A significant proportion of the borrowers in Raebareli also faced the problem of inadequate loans. As many as 33 per cent of the borrowers in this district stated that loan amounts are inadequate. In contrast, only 14 per cent of the sample households in Sultanpur district received madequate loan amounts. This is further corroborated by Table 12 which provides a distribution of loans on the basis of percentage shortage in the amount received to the amount needed. In the case of 70 per cent of the loans in Sultanpur, there was no shortage. The percentage of loans sanctioned without any shortage is less in Raebareli. There was a shortage of 25 to 50 per cent in the case of 20 per cent of the loans in Raebareli. The corresponding proportion in the pilot district is only 6 per cent. Thus, a significant proportion of the loans in the control district fell well short of amount needed. About 30 per cent of the loans in the Sultanpur district also fell short of the amount needed - but the percentage of shortage is insignificant.

The evidence on number of visits paid to credit agencies and the number of days spent by the borrowers to get a loan is presented in Tables 13 to 15. On an average,

Note: Figures in brackets indicate the number of loans.

borrowers in Sultanpur paid three visits and spent 15 days to get a loan sanctioned. The corresponding figures are four and 28 in Raebareli. This variation is due to political power existing at that time. It has been evidenced that banking activities in the Sultanpur district have been simplified and consequently, borrowers would spend lesser time in obtaining a loan. State intervention through its development agencies as promoters in providing loans contibuted in reduction visits and delay in loan sanction.

Evidence on the number of visits and time taken to get a loan sanctioned according to type of loan is presented in Table 16. Surprisingly, crop loans in Sultanpur takes relatively more time to be granted. On the other hand, loans for non-farm petty activities such as shoe-making and so on, take as many as 54 days in Raebareli. Given the fact that these loans are generally meant for the poor, it can be concluded that the poor seem to be spending more time in obtaining a loan in Raebareli.

The efficient function of credit agencies depends on the infrastructure it has at the functioning level. Hence some of the related indicators to manpower and machinery were analysed. Normally the field officer is the person who plays major role in sanctioning of loans. To function efficiently one field officer is appointed for 750 borrowers. Comparing between two districts we see the variation in coverage of borrower by field officer across the district. In Sultanpur district, most of the selected banks in the district have a field officer per 750 borrowers. On the other hand, the field officers in Raebareli were supervising, on an average, more than 750 borrowers and in other districts a field officer supervise more than 1,500 borrower [Vyasulu and Rajasekhar 1995]. The lower burden of work on the field officer indirectly contributes to the effective delivery of credit, as the field officer can clear files quickly (see Table 17 and Table 18).

The field level staff is required to undertake field visits at fixed intervals normally. The field officers are spending, on an average, 11 days in a month on field visits, while their counterparts in Raebareli spend nine days. The difference between the expected and actual number of visits is only marginal in both the districts. Field officers from commercial banks spend fever days than those from rural-based institutions such as RRBs and PACs in visiting borrowers (Table 19).

Almost all the field officers from the selected banks visit borrowers in both the districts. In the Sultanpur districts, all the field officers (excepting those from LDBs as they do not lend short-term loans) visited the borrowers before sanctioning short-term loans. On verification, we found that the field officers would not visit the borrowers

in case of crop loans. Regarding visits before sanctioning the long-term loans, all the field officers (excepting those from PACs because they do not lend long-term loans) visited the borrowers (Table 20) The proportion of field officers visiting borrowers after sanctioning the loan is 100 per cent.

The branch managers from both the districts face the problem of inadequate field level staff; the percentage of branch managers facing this problem is 24 and 64 in Sultanpur

and Raebareli, respectively. A majority of the branch managers facing this problem come from commercial banks and this is consistent with our earlier finding. They also face problems regarding infrastructural facilities. In the absence of adequate infrastructure, a significant proportion of branch managers in both the districts face difficulties in fixing the visits for field officers. These problems compelled 40 per cent of the branch managers in Sultanpur to state that the pilot project brought in additional work (Table 21).

Transport seems to be an important problem for a majority of the field officers in the pilot district. As many as 27 per cent of the total field officers are not provided with the transport and the bulk of them are from the PACs. Only 14.8 per cent of the total field officers in Raebareli are not provided with the transport. A majority of the field officers in both the districts are provided with jeep or motor cycle or both. A majority of the field officers at times share their vehicles with other staff members and such sharing causes inconvenience to most of the field officers from the pilot district. Another disturbing feature is that the maintenance allowance is provided to only a few of the field officers and they do not consider it to be adequate. On the other hand, a majority of the field officers in Raebareli are provided with maintenance allowance and all of them consider it to be adequate.

A majority of the field officers in both the districts face problem due to borrowers' indifference. It is not surprising that the field officers in Raebareli district face this problem. But, what is surprising is a majority of the field officers in Sultanpur face this problem as also that of transport. In Raebareli, the proportion of field officers facing the problem of inadequate transport is relatively less. The proportion of field officers who opined that the maintenance allowance is inadequate is significant in both the districts. Nearly two-thirds of the total field officers in Raebareli district face problems of periodical desk work and government scheme loans.

#### IV Conclusions

The analysis supports the hypotheses that the politically represented district will have better service compared to other. And further it corroborates the argument once the political power reduced the development of the activities also slows down. Another aspect quality of delivery of credit, such as timely and adequate is correlated with the existing political power in that constituency. In spite of the problems at credit agency level, Sultanpur district seems to have better credit delivery system. Although field officers complained that the borrowers are indifferent (and vice versa), the bank-borrower relations seem to have improved. The activities of

granting loans seems to have brought more borrowers' confidence. Most of the borrowers seem to be receiving adequate loans. Thus, as far as the qualitative improvement of credit delivery system is concerned, Sultanpur district seems to have a better position.

In Sultanpur district the recovery of loans.

In Sultanpur district, the recovery of loans has been good, in spite of the adverse political environment prevailing all over the country. Our comparison of the credit delivery system in Sultanpur and the Raebareli district, Racbareli, reveals that the latter did as well or better than the Sultanpur district. This intriguing phenomenon may be explained with the help of the following factors. Firstly. for a long time, Raebareli, being a VIP parliamentary constituency, had political patronage. In other words, the banking system in this district enjoyed (and is enjoying) all the benefits. Secondly, the infrastructural facilities, and the persons manning them. function in Raebareli in an above average manner. Hence, it is not surprising that Raebareli's performance is as good as Sultanour's, though the former is not having a compared VIP person. But, overall, ever in this comparison, we have seen that Sultanpur is in a better position.

#### Appendix: Note on Methodology

To collect information on rural creditelivery system, the districts were divided into two areas — one that is relatively well-off in economic terms and one that is relatively poor. In general, this corresponded to areas with higher and lower levels of banking activity.

In the well-off area of the district, sip branches of each type of institution were selected and surveyed. This will total to 24 branches. In the poorer area of the district three branches of each type of institution were selected and surveyed. This totalled to 12. Thus, in a district, information wa collected from 36 bank branches representing both category 'A' and category 'B institutions.

Detailed information was collected from the credit agencies, to note the strength and weakness of credit agencies at functioning levels. The details collected were, the type of loans given by each bank, along witl other details such as age structure of defaults were obtained. From the well-off part of the district, one branch from each credit agencwas selected. From these branches, there was a scrutiny of 160 cases in each branch including 60 who had repaid loans on tim and 100 who were defaulters. In the sam way, four branches were selected in the poo area and there will be a scrutiny of 80 case including 20 who have repaid loans on time Thus, in each district, there was a scrutin of 720 loans distributed across differer

A = Percentage of field officers saying yes; B = Number of field officers.

representing majortypes of loans, combining both the district the information collected total loans are 1,440.

An effort was made to divide defaulters, based on the judgments of the field officer, into those who are wilful defaulters and those who default for reasons beyond their control. From the 720 households in each district, 87 and 98 samples were selected through purpose random sampling method, though we planned to collect 100 from each for primary survey and household questionnaires were administered to them.

#### **Notes**

[I am grateful to Vinod Vyasulu, director, Development Research Foundation-TIDE, for his advice and consistent support in preparation of this paper. This paper is based on field work conducted as part of a larger study in the RBI Unit of ISEC. The research was funded by NABARD. The views expressed, are, however, my own, and cannot be attributed to any of these agencies.]

- 1 In India, the commercial banking sector is dominated by the public sector banks. They control 90 per cent of both deposits and advances.
- 2 Veerashekharappa, 'Patter and Utilisation of Farm Finance, A Micro Level Study Focusing

Department of Economics, Osmania University, Hyderabad, in this dissertation, very well documented how the political intervention has helped to get loan from RRBs and Co-operative institutions.

- 3 Social Services Management Unit, 'Strengthening the Credit Delivery System', Institute for Social and Economic Change, Bangalore.
- 4 This district, because of VIP representation a host of programmes have been implemented, viz,
  - Agriculture extension programme (T and V), under this programme good efforts were made in extension of agriculture technology
  - The special rice production programme
  - The special tood production programme.
  - Incentive to industry under the "No Industry"
  - Project on strengthening rural credit
- 5 The development activities in these district are different from others, a couple of programmes in these districts were monitored by the prime minister's office, during their representation.
- 6 It has been assumed that the pull factor is determined by the market forces whereas the push factor in determined by the force of the state. For example, the pull factor contributes to the opening branches in metropolitan area whereas the push factor contributes to the opening of branch in

7 The number of branches:

......

|               | 1969  | 1994   |
|---------------|-------|--------|
| Uttar Pradesh | 747   | 8,700  |
| All India     | 8,262 | 61,750 |

- 8 Population reduced from 1,19,000 to 13,000 per branch in UP.
- 9 This conclusion is out come of the discussion with administrators bankers and borrowers during the survey period
- 10 The discussion with LBOs and other officials are revealed that there was lot of pressure on the official in speeding up opening of the branches and extending credit.

### **Cooking the World**

Ritual & Thought in Ancient India

Charles Malamoud

The essays in this volume attempt to unravel the doctrine on man that is condensed into this sentence. They examine and explore the culture and forms of thought revealed in Vedic hymnis and associated treatises on sacrifice. The title Cooking the World, comes from the Sanskrit expression. Lokapakti man 'cooks' the world and, in executing the rites, himself gets cooked.

## **Industrial Organization**

(Readers in Economics)

#### Edited by Anindya Sen

This volume is a theoretical introduction to many of the major issues in industrial organization — theory of the firm, static oligopoly models, price discrimination, product differentiation, entry deterrence and collusion and innovation. The readings have been selected in view of their applicability to developing countries and thus include contributions on regulatory policy and performance of public sector enterprises in the market-place.

# Industrial Concentration and Performance

A Study of the Structure, Conduct and Performance of Indian Industry

#### Uma S. Kambhampati

This book is one of few studies on the microeconomic performance of Indian industry. It tackles questions relating to the nature of competition in Indian industry — whether the private sector in India is concentrated, and whether firms in concentrated private sector industries compete or collude.

# Agriculture in Future: Demand-Supply Perspective for the Ninth Five-Year Plan

#### Praduman Kumar V C Mathur

This paper provides information on demand for agricultural commodities and suggests the required stell growth in Ninth and Tenth Five-Year Plans. The study identifies the regions which must be explored to meet domestic and exports needs.

THE introduction and rapid spread of highhelding varieties in the late 1960s and early 1970s resulted in a steady output growth for oodgrains Public investment in nfrastructure, research and extension along with crop production strategy has ignificantly helped to expand foodgrain production and stocks Foodgrain production. which was 72 million tonnes (mt) in 1965-56, rose to 191 mt in 1995-96 Buffer stocks, which were just 2 2 mt in 1965-66, rose to 31 mt in 1995. However, the current concern is that the earliest gains from the green revolution have already been reaped and future growth in production can only be input based in many regions of the country Also the growth in total factor productivity is declining Urbanisation higher economic growth as well as streable additions to population will increase the food demand in future Diversified food basket is exhibited both in rural and urban areas with significantly higher levels of per capita consumption of milk and milk products, truits and vegetables, and meat [Kumar 1996] Agricultural trade liberalisation may attract greater investments in agriculture and thereby accelerate the growth process. These emerging scenarios will change the supply and demand prospects for food in the next century The present paper provides information on the demand for agricultural commodities in Ninth and Tenth Five Year Plans (FYP) and suggests the supply policies to attain the food security

## Demand Projections

A number of demand models are available tor estimating the income and price elasticities of demand for a commodity Recent demand studies are centred around complete demand systems which take into account mutual interdependence of a large number of commodities in the budget decisions of the consumer. The important models which have received considerable attention are the linear expenditure demand system (LEDS) [Stone 1954], and almost ideal demand system (AIDS) [Deaton and Muelibauer 1980]. These models are

generally used for estimating demand equations for a group of commodities and not for commodities at a disaggregate level Also these models do not allow increasing or decreasing income elasticities. The normalised quadratic demand system (NQDS), generalised Leontief demand system (GLDS) and transcendental logarithmic demand system (ILDS) suggested by Swainy and Binswanger (1983) are the models which satisfy all general restrictions of demand theory and also allow for estimation of cross-price elasticities within a group of close substitutes or complements, and do not assume additivity These models also include linear and squared income terms which allow more flexibility in the response of consumer items to changes in income In contrast to econometric models Bouis (forthcoming) suggested a non econometric model based on demand characteristics known as food characteristic demand system (FCDS) This model is based on demand for energy, variety, and tastes

The expenditure (income) and caloric elasticities based on FCDS, TLDS NQDS and LEDS were compared so that realistic view of demand forecast can be assessed (Table 1). The rice income elasticities are high, followed by wheat and coarse grains. The cheapest source of calories has the lowest income elasticities. The caloric elasticity was the lowest derived from demand parameters of FCDS (0.12) tollowed by LEDS (0.42.0.46), NQDS (0.49-0.53) and highest in case of TLDS (0.51-0.60).

Behrman and Deolalikar (1989) have presented empirical evidence for Indian population to show that calone income elasticities were not statistically significantly different from zero. Thus one can believe that the demand elasticities obtained from FCDS can give most reliable demand projections for foodgrains and other food commodities.

Demand elasticities vary widely across income groups and by regions as production environments and tastes change [see Alderman 1986 for a review | The elasticities computed for various expenditure groups1 tor each region2 for rural and urban areas using FCDS [Kumar et al 1996] are used to arrive at the demand projections for each commodity As seen in Appendix 1 the expenditure and price elasticities are in accordance with a priori expectations. The expenditure elasticities decline with the increase in total expenditure. The expenditure elasticities for cereals were highly inelastic Own price elasticities for all the commodities are negative. Across commodities and expenditure groups the magnitude of own price elasticities are highly correlated with the income elasticities. The magnitude of elasticities follow the historical trends in percapita consumption pattern as observed in the NSS data

The demand projections of our study assume income growth of 5 per cent per year gradual decline in population growth, with an average annual growth of 1 91 per cent between 1995 and 2000 and 1 8 per cent between 2000 and 2010 tate of urbanisation

Note Other food includes all foods other than cereals

consistent with the recent historical trend,. and inequality in the distribution of expenditures across income groups the same as observed in the past. The share of rural population in total population was 74.3 per cent in 1991 which was predicted to be 73.4 per cent in 1995, 72.3 per cent in 2000 and 69.9 per cent in 2010. Distribution of population by expenditure groups given in Appendix 2 revealed that the rural poverty ratio (the sum of population proportion of lower two expenditure groups) declined from 48 per cent in 1987 to 33 per cent in 2000 and 21 per cent in 2010 and urban poverty ratio from 29 per cent in 1987 to 16 per cent in 2000 and 8 per cent in 2010. It is clear that in the long run, food consumption will largely be influenced by the non-poor groups in the rural and the non-poor higher groups in urban areas. Significantly, in 2010 food consumption will be determined by the nonpoor higher groups in both rural and urban areas which account for half of the rural and three-fourths of the urban population, respectively

#### DOMESTIC DEMAND FOR FOODGRAINS

Several studies done in the past provide the demand projections for foodgrains in the year 2000 (Table 2). Among the most recent ones, the demand estimates given by Radhakrishna and Ravi (1990) are on higher side as they use high expenditure elasticities. Similarly, projections by Sarma and Gandhi (1990) are on the higher side because of double counting in estimation of wastage and livestock feeding<sup>1</sup>. Bansil (1996) projected the demand for foodgrains at 198 mt in 2000 which is on the lower side. This study is based on the incremental approach, providing additional requirements for household and non-household demand over the base year's production of foodgrains. It does not account for regional variations in consumption pattern and changes in income distribution. Rosegrant et al (1995) provided food projections for IFPRI's 2020 vision based on the International Model for Policy Analysis of Agricultural Commodities and Trade (IMPACT). The demand for rice and coarse cereals is on the higher side and demand for wheat is on the lower side in this study as the model does not account for regional variations in consumption pattern and the changes in income distribution. It uses demand supply elasticities and technical coefficients synthesised from other sources, primarily from past studies. The results are not the true reflection of ground realities. The demand projections based on FCDS [Kumar et al op cit] are close to reality as these projections account for regional variations in consumption pattern and changes in income distribution besides taking into account the energy requirements and changes in tastes and preferences of consumers for food varieties.

According to our estimates, the household demand of foodgrains will reach 186 mt in the year 2001-02 with a break-up of about

83 mt of rice, 64 mt of wheat, 23 mt of coarse grains, and 16 mt of pulses (Table 3). By the year 2006-07, foodgrains demand will grow to 205 mt with a breakup of about 91 mt for rice, 71 mt for wheat, 24 mt for coarse

| Total Foodgrains                                 |                | -     | 214.8             |                  | 209 4            |

- Notes: a Without change in income distribution.
  - b With change in income distribution.
  - c Projected the requirements for seed, feed, industrial use and wastage. Feed demand is computed using the feeding ratio (that is, the quantity of feed required to produce one unit of livestock products).
  - d Using incremental demand model by providing additional requirement for household and non-household over the base year demand.
  - e Using a grossing factor of 1.143 to account for non-household demand
  - f Interpolated for the year 2000.
  - g As the demand projection for pulses was not available in the study, the pulse demand projections of IARI-IFPRI study are used to arrive at the foodgrain demand for comparison purpose.

TABLE 3: DOMESTIC DEMAND FOR FOODGRAINS 'N INDIA

(Million tonnes)

| Items            | 1991-92     | 1996-97 | 2000-01 | 2001-02 | 2006-07 |
|------------------|-------------|---------|---------|---------|---------|
|                  | (Base Year) |         |         |         |         |
| Plan End         | VII         | VIII    | . –     | ΙX      | x       |
| Household Demand |             |         |         |         |         |
| Rice             | 67 1        | 75.0    | 81.5    | 83.0    | 91.3    |
| Wheat            | 50.8        | 57.1    | 62.5    | 63.7    | 70.9    |
| Coarse cereals   | 20.3        | 21.6    | 22 7    | 22.9    | 24 2    |
| Total cereals    | 138.2       | 153.7   | 166 7   | 169.6   | 186.4   |
| Pulses           | 11.7        | 13.9    | 15.6    | 16.1    | 188     |
| Foodgrains       | 149.9       | 167.6   | 182.3   | 185.7   | 205.2   |
| Domestic Demanda |             |         |         |         |         |
| Rice             | 72.6        | 81.2    | 88.2    | 89.8    | 98.8    |
| Wheat            | 57.8        | 65.0    | 71.1    | 72.5    | 80.7    |
| Coarse cereals   | 28.9        | 30.7    | 32.3    | 32.6    | 34.4    |
| Total cereals    | 158.0       | 175.7   | 191.6   | 194 9   | 213.1   |
| Pulses           | 13.4        | 15.9    | 17.8    | 18.4    | 21.5    |
| Foodgrains       | 171.3       | 191.6   | 209.4   | 213.3   | 234.5   |

a Domestic demand = Household (human) demand plus allowances for seed, feed and wastage which is taken as 7.6 per cent of gross rice production, 12.1 per cent of wheat, 29.7 per cent of coarse cereals, 12.5 per cent of total cereals, 12.5 per cent of pulses, and 12.5 per cent of foodgrains. Thus the grossing factor used is 1.082 for rice, 1.138 for wheat, 1.422 for coarse cereals, and 1.143 for total cereals, pulses and total foodgrains to account for non-household demand.

cereals and 19 mt for pulses. Apart from the foodgrain demand for direct human consumption, an increasingly important component is the indirect demand for livestock consumption.4 Increasing demand for livestock products (milk, meat and eggs) will drive up demand (including feed, seed, industrial use and wastage) for foodgrains to 213 mt in 2001 and 235 mt in 2006. In 2001, domestic demand for rice will be about 90 mt, wheat 73 mt, coarse cereals 33 mt and pulses 18.4 mt. In the year 2006, demand will reach to 99 mt for rice, 81 mt for wheat, 34 mt for coarse cereals and 22 mt for pulses. During the Ninth Five-Year Plan period, domestic demand will grow at the annual compound growth rate of 2.11 per cent for rice, 2.21 per cent for wheat, 1.21 per cent for coarse cereals and 2.96 per cent for pulses. The demand of total foodgrains will grow at the rate of 2.17 per cent.

#### DOMESTIC DEMAND FOR NON-FOODGRAINS

In the year 2001-02, the demand for vegetables will be 92 mt, fruits 53 mt, edible oils 7.9 mt, cotton 2.4 mt and sugar 16.8 mt (Table 4). Among livestock products, the demand of milk will reach 93 mt, meat and eggs 5 mt and fish 7 mt. In 2006-07. total demand will reach 109 mt for vegetables, 69 mt for fruits, 120 mt for milk, 9.5 mt edible oils, 15 mt for eggs, meat and fish. 2.9 mt for cotton and 19.6 mt for sugar. During Ninth FYP, the total demand will grow at the annual rate of 5.2 per cent for milk, 4 per cent for edible oils, 3.5 per cent for vegetables, 5.4 per cent for fruits, 5.1 per cent for meat and eggs, 5.6 per cent for fish, 3 per cent for sugar, and 3.6 per cent for cotton. Thus increase in demand for nonfoodgrains will be much higher than the growth in population.

#### EXPORTS OF AGRICULTURAL COMMODITIES

The countries of south Asia, south-east Asia, west Asia, North Africa, sub Saharan Africa and the former Soviet Union and eastern Europe offer India the advantages of locational proximity and product acceptability for the exports of agricultural products. Based on the estimates of production for 2020 [Rosegrant et al 1995]. it is expected that there would be a deficit of 63.7 million tonnes of wheat in south Asia, China, south-east Asia, west Asia and North Africa and sub Saharan Africa in the year 2001 and 71.5 million tonnes in 2006 (Table 5). India can easily capture 5 per cent of this potential wheat market. Thus the exports of wheat from India can be targeted at 3.2 mt in 2001 and 3.6 mt in 2006. India is currently exporting about 1 million tonnes of wheat.

There has been a remarkable progress in the rice exports during the current year. This assumes larger significance with increased buying interests from qualityconscious markets of Europe, America, Korea, etc. The Indian non-basmati rice export figures have touched an all-time high of 3 mt during 1994-95. Total rice exports (basmati and non-basmati) from India attained a level of 3.51 mt. A deficit of 8.4 mt in the year 2001 and 9.4 mt in 2006 is expected in west Asia and North Africa, sub Saharan Africa and the former Soviet Union. India has a diversified export market for rice which includes a large number of countries in south and southeast Asia, west Asia, Africa and Europe. India can capture 50 per cent of these

markets and can aim to export 4.2 mt in 2001 and 4.7 mt in 2006.

In addition to foodgrains, India has the potential for exporting cotton, vegetables, fruits and marine products. Assuming likely exports to be 10 per cent of cotton production, 2 per cent of fruits and vegetables, and 5 per cent of fish production, India can aim to export 0.24 mt cotton, 1.9 mt

TABLE 7 TOTAL FACTOR PRODUCTIVITY GROWTH (Per cent)

| Crop          | 1971-80 | 1981-88 | 1971-88 |

vegetables, 1.1 mt fruits, and 0.37 mt marine products in the year 2001.

## TOTAL DEMAND FOR AGRICULTURAL COMMODITIES

The demand for foodgrains (including feed, seed, wastage and exports) in the years 2001 and 2006 will be 220.5 mt and 243.2 mt, respectively (Table 6). In the year 2001, the demand for rice will be 94 mt, wheat 75.7 mt, coarse cereals 32.6 and pulses 18.2 mt. Among non-foodgrains, the demand for edible oils will be 7.9 mt, vegetables 93.6 mt, fruits 53.7 mt, sugar 16.8 mt and cotton 2.64 mt (15.53 million bales of 170 kg cach) in 2001. In the same period, demand for milk will be 93.4 mt, meat and eggs 4.6 mt and marine products 7.5 mt.

# II Supply of Agricultural Commodities

TECHNOLOGICAL CHANGE

Indian agriculture has undergone a technological change at different rates in different regions and among different crops which has resulted in substantial increases in marketable surplus of wheat and rice and contributed to achieving food security mainly by inducing a decline in real prices of rice (2.2 per cent) and wheat (3.3 per cent). The new technologies increased the dependence of farmers on modern inputs and substantially increased the cost of production per unit of land at constant prices. But the increase in yield has been much higher than the increase in real cost of production and hence the cost per unit of output has declined for rice (at the rate of 1.1 per cent in eastern region, 2.14 per cent in northern region and 3.9 per cent in the southern states) and wheat (ranging from 2.0 per cent to 2.8 per cent in different wheat growing states) [Kumar and Mruthyunjaya 1992; Kumar and Rosegrant 1994]. The benefits of higher efficiency in the use of inputs and low unit cost of production that the MVs and improved farming practices have generated have quickly passed on from farmers to consumers in the form of lower prices. The fall in prices has benefited the urban and rural poor much more than the upper income groups, because the former spend a much larger proportion of income on cereals than the latter.

The increase in area and production of crops is highly associated with their relative profitability. Rice gained area mainly through substitution effect at the cost of coarse cere als and wheat mainly through expansion effects because of phenomenal growth of tubewell irrigation in the wheat belt. For rice, during 1967/68-1989/90, the area increased at the annual rate of 0.6 per cent per annum and

Notes: TE 1994-95: Average triennia ended 1994-95.

Prod: Production target which is equal to human demand plus non-human demand (seed, feed, wastage) plus export.

The area is projected for the year 2001-02 based on compound annual rate of change between the triennias ending 1988 and 1994 with the assumption that the area under crop will stabilise after 2001-02.

- a It is assumed that the share of jowar in total coarse cereals will decline from 34.2 to 32.3 per cent in the year 2001-02, share of bajra from 21.5 to 20.2 per cent; the share of maize in total coarse cereals will increase from 29.4 per cent in TE 1994-95 to 35 per cent in 2001-02 and to 40 per cent in 2006-07.
  - After end of 2001-02, the demand for coarse cereals will be met from maize.
- b The groundnut and rapeseed and mustard will meet 34 and 31 per cent of the edible oil requirement respectively. The share of soybean in total edible oil is 5.9 per cent in TE 1994-95 which is likely to increase to a level to 15 per cent by 2001-02. The conversion factor from oilseed to oil is 28 per cent for groundnut, 33 per cent for rapeseed and mustard, and 18 per cent for soybean.
- c Gram and arhar will meet 39 per cent and 18 per cent respectively of the total pulse demand.

Note: na - not available

production showed an increase of 2.7 per cent mainly because of yield growth. The area under rice has increased only slightly during the 1980s. The gains in rice production have come essentially from the improved utilisation of the available infrastructure and from the resulting increase in yield per unit of land. Acceleration in yield growth need not imply that the potential productivity from the inputs has been fully realised. Spread of inputs in the new areas where the existing level of application is relatively low will contribute to the increase in the productivity per unit of input as well as ensuring more equitable distribution of benefits.

The rapid growth in irrigated area under wheat and spread of modern varieties during 1967-72 resulted in a extraordinarily high rate of growth in wheat production (9.7 per cent). Nearly half of this increase was contributed by yield gains. In the following decade, the rate of production increase declined to 2.4 per cent per year with yield gains slowing down to 2.6 per cent annually. This is because the use of modern inputs in wheat reached ceiling levels, particularly in the frontline states. The scope for further expansion of area under wheat is bleak even in the northern states. Coarse grains gained growth in production (1.4 per cent for maize, 1.3 per cent for sorghum and 0.4 per cent for pearl millet) through yield effects in spite of a declining trend in area of sorghum and pearl millet.

The growth in total factor productivity (TFP) during 1971-88 is estimated at about 1.03 per cent for rice, 1.26 per cent for wheat and 1.01 per cent for coarse grains (Table 7). More than one-third of output growth in cereals is contributed by TFP. TFP and growth in crop inputs have contributed significantly to the production of rice and wheat, and have enabled India to increase availability of foodgrains per capita in the presence of high population growth rates and limited land resources. Deceleration in the growth of TFP is observed. This slowdown process has been explored in more details by Kumar and Rosegrant (1994) in case of rice, by Kumar and Murthyunjaya (1992) in case of wheat, and Rosegrant and Evenson (1992) for Indian crop sector as a whole. Market infrastructure, research, irrigation, and balanced use of fertilisers are identified as the most important sources of growth in TFP. Other authors have attributed this slow-down to a reduction of growth following exploitation of early productivity gains from adoption of modern varieties and declining trend of investment in agriculture during 1980s. Real investment in irrigation by the public sector declined during the 1980s at the rate of 1.73 per cent per annum [Rao 1993]. Increasingly, soil salinity and waterlogging problems also contribute to declining productivity [Joshi and Agrihotri 1982; Joshi and Jha 1991].

#### YIELD GROWTH IN NINTH PLAN

Future increases in the production of food and non-food agricultural commodities have to be essentially achieved through increases in productivity as possibilities of area expansion are minimal. Around three million hectare crop area is predicted to the shifted from foodgrains to non-foodgrains. To meet the growing domestic and export needs, the average yield at national level

is required to be improved by 30 to 50 per cent for various commodities by the end of the Ninth Five-Year Plan (2001-02) (Tables 8 and 9). The country should attain a per hectare yield of 2.2 tonnes for rice, 2.9 tonnes for wheat, 1.1 tonnes for coarse grains, 0.84 tonnes for pulses, 1.1 tonnes for oilseeds, 0.34 tonnes for cotton, 80 tonnes for sugarcane, 17.7 tonnes for vegetables and 16.8 tonnes for fruits by 2001-02. It requires an annual yield growth of about 2.5 per cent for foodgrains, 4.5 per cent for pulses, 3.9 per cent for oilseeds, 3.8 per cent for cotton, 3.5 per cent tor vegetables, around 6 per cent for fruits and

Notes: LYS-States which achieved yield below the required national average in 2001-02, HYS-States which achieved yield above the required national average in 2001-02

milk and livestock products and 3 1 per cent for sugarcane (Table 10). In case of soybean, production targets will be achieved as a result of area expansion, even though there may be a slight decline in yield per hectare.

Looking at the past performance of 1990-94 we have achieved a yield growth which is much lower than needed during the Ninth FYP. This is not a simple task and serious efforts will have to be made by the agricultural scientists and extension agencies to improve production. More than half of the required growth in yields must be met from research efforts by developing locationspecific and low-input-use technologies. The productivity increases need to be achieved from all the states of India. However, required increments in yield levels cannot be expected from high yield states (HYS), which are the states in which current yield levels are above the required national average in 2001-02, as these states account for only around onefifth of the crop area for most of the crops (Table 11). Hence yield improvements must come from the low yielding states (LYS), which are the states in which current yield levels are below the required national average yield in 2001-02. The classification of HYS and LYS by crop is presented in Appendix 3. Under the scenario of yield improvement from the HYS ranging from 0 to 2.5 per cent, the required yield target for the LYS is presented in Table 12. The most likely scenario for HYS is 0 to 1 per cent per annum improvement in yield. Thus, to ensure future food security, efforts must be made to improve the yield for LYS from existing levels of 1.53 tonnes to 2 tonnes for rice. 2 tonnes to 2.63 tonnes for wheat, 0.79 tonnes to 0.92 tonnes for coarse cereals, 0.53 tonnes to 0.83 tonnes for pulses, 0.83 tonnes to 1.07 tonnes for oilseeds, 0.22 tonnes to 0.32 tonnes for cotton and 57.9 tonnes to 76 tonnes for sugarcane by 2001. This means there is a need to increase the per hectare yields substantially (30-50 per cent) in the next five years. Thus there is a need to attain the higher yield growth during Ninth FYP than attained during 1980-94. The yield growth target for LYS needs to be fixed at 3.6 per cent for rice, 3.3 per cent for wheat, 1.87 per cent for coarse cereals, 5.92 per cent for pulses, 3.27 per cent for oilseeds, 3.43 per cent for sugarcane and 5.02 per cent for cotton (Table 13). The required growth in vield from the LYS is substantially higher for pulses, oilseeds, sugarcane and cotton than achieved in the past.

Emphasis needs to be given for yield improvements in paddy in the states of Bihar, Orissa, Assam, West Bengal and Uttar Pradesh (Table 14). For wheat we must focus mainly on Uttar Pradesh, Madhya Pradesh, Bihar and Rajasthan. For coarse cereals, major emphasis must be given to

Notes: AP: Andhra Pradesh, AS: Assam, BH: Bihar, GJ: Gujarat, HP: Himachal Pradesh, KN Kornataka, MP: Madhya Pradesh, MH: Maharashtra, OR: Orissa, RJ; Rajasthan, UP: Uttar Pradesh, WB: West Bengal.

Kajasthan, Maharashtra, Karnataka, Madhya Pradesh, Andhra Pradesh and Uttar Pradesh. To meet the demand for pulses greater emphasis is needed in almost all the states with particular focus on Madhya Pradesh. Maharashtra, Rajasthan, Gujarat, Andhra Pradesh, Karnataka and Uttar Pradesh which have three-fourths of total pulse area. The target growth in pulse yield from these states annually must be 6 per cent; otherwise the nation will experience shortage of pulses for all times to come. The task of attaining self sufficiency in pulse production looks difficult without area expansion and irrigation. In case of oilseeds greater emphasis is needed for all the LYS states which occupy 92 per cent of the area with special emphasis on Andhra Pradesh, Madhya Pradesh, Rajasthan, Maharashtra, Karnataka, West Bengal and Uttar Pradesh to increase the yield by about 4 per cent. The possibilities of developing processing industry for extracting edible oils from non-oilseeds commodities, like rice bran, etc, need to be explored. The introduction of palm cultivation for oil production may release the pressure on traditional oilseeds crops to meet future edible oil demand. In case of sugarcane research and development efforts are to be strengthened in Uttar Pradesh and Bihar to increase the yields per hectare by about 4 per cent per annum. The demand for sugar can also be met by developing mini sugar mills so that substantial sugarcane production can be diverted from khandsari to sugar production. This may also help release some sugarcane area to other crops. Cotton is emerging as a potential export commodity. It requires greater yield improvement emphasis on 81 per cent of the cotton area in Maharashtra, Gujarat and Andhra Pradesh.

#### III Conclusions

Vast untapped potential exists for increasing the production of all the commodities. What is needed are serious efforts on the part of scientists, and extension and development agencies to attain the targeted growth in yields from LYS and transcending the yield levels in HYS. Most LYS have low level of irrigation and technology. Greater research emphasis needed for dryland agriculture.

The challenge to sustain food security will be difficult for any country that has a large proportion of rainfed and unfavourable foodgrowing environment. Rainfed areas, which account for about 70 per cent of India's cultivated land, play a key role in meeting future food needs, in generating employment, and in promoting national economic growth. Resource-poor farmers in the rainfed ecosystems practise less-intensive

agriculture, and since their incomes depend on local agriculture, they benefit little from increased food production in irrigated areas. To help them, efforts must be increased to disseminate available dryland technologie and to generate new ones. It will be necessar:

Notes: I: Very poor, II: moderately poor, III: non-poor low, IV: non-poor high.

The elasticities for each expenditure group for rural and urban areas are derived as the weighted average of the elasticities of the regions. The ratio of the consumption of it region to the aggregate consumption of all regions for each expenditure class in the rural urban areas is used as weight. Similarly aggregated elasticities for rural and urban area have been derived as the weighted average of the elasticities of the expenditure groups

to enlarge the efforts for promoting available dry land technologies, increasing the stock of this knowledge, and removing proirrigation biases in public investment and expenditure, as well as credit flows, for technology-based agricultural growth. Research problems in rainfed unfavourable ecosystems and breaking of the current irrigated yield ceiling are more complex and challenging. To make headway on them will require mobilising the best of science and the best of scientists in national agricultural systems through partnership research.

Phosphorus deficiency is now the most widespread soil fertility problem in both irrigated and unirrigated plots in the country [Kumar and Desai 1995]. Correcting the distortion in relative prices of primary fertilisers could help correct the imbalances in the use of primary plant nutrients nitrogen, phosphorus, and potash. Recent initiatives taken by the government to remove such imbalances in fertiliser use are a welcome move. To improve efficiency of fertiliser use, what is really needed is enhanced location-specific research on efficient fertiliser practices (such as balanced use of nutrients, correct timing and placement of fertilisers, and, wherever necessary, use of micronutrients and soil amendments). improvement in extension services, development of improved fertiliser supply and distribution systems, and development of physical and institutional infrastructure [Desai 1986].

The scope for influencing long run productivity growth through manipulation of crop prices is limited. Reforms of trade and macro-economic policy are needed to encourage long-term investment and technological change in agricultural sector. The increasing complexity of production

environment demands efficient information dissemination and training in the use of modern technologies. For this, the extension strategies need to be reoriented to stimulate and encourage both top-down and bottom-up flow of information between farmers, extension workers and research scientists to promote the generation, adoption and evaluation of location-specific farm technologies.

Creating infrastructure in less developed areas, Watershed development for raising yields of rainfed crops, widening of seed revolution to cover oilseeds, pulses, fruits and vegetables, improvement of agricultural credit, and technological upgradation of postharvest handling are areas which need more attention.

#### Notes

[The paper is drawn from the study 'Food and Nutrition Security Issues' conducted under the Centre of Advanced Studies, Division of Agricultural Economics, Indian Agricultural Research Institute, New Delhi-110012. The authors gratefully acknowledge the help and guidance of R B Singh, IARI, D Jha, NCAP, and S L Mehta, ICAR, New Delhi. An earlier version of the paper was presented in the National Seminar on Agricultural Development Perspective for the Ninth Five-Year Plan organised by Indian Institute of Management, Ahmedabad.]

1 The expenditure strata, four for the rural and four for the urban, are formed on the basis of the poverty lines adopted by the Planning Commission. Based on the expenditure classes of NSS, persons below 75 per cent of the poverty line are defined as very poor, between 75 per cent and poverty line as moderately poor, between poverty line and 150 per cent of the poverty line as non-poor lower, and ex-penditure classes above 150 per cent of poverty line as non-poor higher Per capita expenditure is taken as a proxy

for income and these terms are used interchangeably in the study.

- 2 In addition to urbanisation and economic status, consumption pattern is also influenced by region. Rice is the main staple food in eastern and southern regions. Wheat is the main staple food in western and northern regions. Sorghum is the second staple cereal in western and southern regions. Demand parameter estimates may vary by region, urbanisation and income group. Thus, for the purpose of analysis, state-wise time series data were aggregated into four regions, namely, eastern region covering the states of Assam, Bihar, Orissa and West Bengal; northern region which includes Haryana, Punjab, Uttar Pradesh, Himachal Pradesh and Jammu and Kashmir; western region covering Gujarat, Maharashtra, Madhya Pradesh and Rajasthan; and southern region covering Andhra Pradesh, Tamil Nadu, Karnataka and Kerala.
- 3 Major part of the wasted grains are fed to livestock, Feed requirements are calculated by converting the livestock products into Livestock Output Unit (LOU) and using the feeding ratio per unit of LOU. The major part of the meat other than chicken is a byproduct of the livestock industry. Even with regards to chicken meat, not more than half is broilers which are fed the concentrates. The remaining half is from the culled layers which again is a by-product.
- 4 Non-household demand is estimated at 11-12 per cent of human demand for foodgrains or 10-11 per cent of the projected gross output [Kumar et al 1996]. These estimates are close to the allowances (12.5 per cent of foodgrains production) used by the ministry of agriculture, government of India (GOI) while computing the availability of foodgrains for human consumption Following the norms of GOI, the grossing factor used is 1.082 for rice, 1 138 for wheat, 1.422 for coarse cereals, and 1.143 for total cereals, pulses and total foodgrains to account for non-household demand. Thus, nonhousehold demand works out to 18 mt and 29 mtin 2001-02 and 2006-07, respectively

APPENDIX 3: CLASSIFICATION OF LOW YIELD AND HIGH YIELD STATES BY CROP

| Crop        | Low Yield States                       | High Yield States              |
|-------------|----------------------------------------|--------------------------------|
| Paddy       | WB, UP, MP, BH, OR, AS, MH, GJ, KR     | AP, TN, PB, KN, HY             |
| Wheat       | UP, MP, RJ, BH, MH, GJ, HP, WB         | PB, HY                         |
| Coarse      |                                        |                                |

# NATIONAL SEMINAR

## ON "PARTICIPATORY TECHNOLOGY DEVELOPMENT IN HORTICULTURE"

Kerala Horticulture Development Programme proposes to organise a two day seminar on "Participatory Technology Development in Horticulture" on 21st and 22nd of November 1996 at Trivandrum. Participatory Technology Development aims at developing site specific technology through farmer centred methods and is being viewed the world over as a viable approach to technology development. Interested persons participating in the seminar may respond on or before 10th October 1996 to:

The Programme Director, Kerala Horticulture Development Programme,

PDR Bhavan, Foreshore Road, Cochin - 682 016.

(Phone: 0484-368713/371055/56. Fax: 0484-370495)

# Public Distribution System, Food Subsidy and Production Incentives

#### PS George

The public distribution system (PDS) in India has close links with food security for the vulnerable segments of the population, budgetary support for food subsidy and the price policy. This paper reviews some aspects of the operation of the PDS and raises some policy issues with regard to scope and coverage of PDS, production incentives to farmers, and the amount of food subsidy.

#### I Introduction

THROUGH state interventions in the foodgrain markets have been in existence in India for a long time, extensive use of this mechanism has been adopted from the second world war period [George 1988; Knight 1954]. A public distribution system that regulated the movement of toodgrains from the surplus production states to deficit states formed one of the core elements of the food management system.2 Over the years there has been a number of attempts to modify the scope and coverage of the public distribution system (PDS). While price stability for the consumers in urban and major food deficit areas was the focus in the early years of planned development, some form of equitable distribution was also envisaged as the objective in the subsequent plan periods. Thus, the Seventh Plan has specified that the PDS will be a permanent feature of the strategy to control price, reduce price fluctuations and achieve an equitable distribution of essential goods [Venugopal 1992]. The procurement operations and distribution through the PDS outlets involved a certain amount of government subsidy. Further, procurement was somewhat linked with the policy of providing a minimum support price to the farmers. Thus, the public distribution system in India has close links with food security for the vulnerable segments of the population, budgetary support for food subsidy and price policy. This paper attempts to review some aspects of the operations of the public distribution system in India and to raise a few policy issues for further consideration.

## Some Basic Indicators

Trends in production, net availability and procurement of foodgrains in India indicate certain broad patterns. As indicated in Tables 1 and A1, between 1951 and 1995, production of foodgrains in India has increased from 48.1 million tonnes to 167.2 million tonnes. Net availability of foodgrains, obtained by making adjustments for net imports and government stocks, indicates that during this period it has increased from 52.4 million tonnes to 167.8 million tonnes. Procurement

. . . . . .

of foodgrains had been somewhat negligible until mid-1960s and then it has increased from 4 million tonnes in 1965 to about 28 million tonnes in 1993. The growth rate of procurement volume has exceeded the growth rate of production, so that the share of procurement in production has increased from 5 per cent in 1965 to 17.8 per cent in 1993 before it dropped to 13.5 per cent in 1995. The offtake from the PDS has recorded a gradual increase from 1.3 million tonnes in 1955 to a maximum level of 20.8 million tonnes in 1991. Except for 1966 and 1967 when the PDS offtake was about 19 per cent of the total availability, throughout the past 25 years, PDS accounted for about 10 to 14 per cent of the total availability of foodgrains.

#### III Procurement

Procurement of foodgrains directly from the farmers or from intermediaries such as traders or millers was taken up either under the support price obligations or to meet the requirements of the PDS. Most of the procurement operations until mid-1960s was to meet the PDS requirements, and this was not vigorously followed up when foodgrains

were available through the PL 480 imports. However, with the commitment to provide a minimum support price to the farmers and the establishment of the Food Corporation of India, procurement efforts are vigorously followed. A review of the procurement experience indicates the following tendencies.

(a) The volume of procurement has increased from 1.1 million tonnes in 1963-64 to about 27 million tonnes in 1993-94. As indicated earlier, procurement volume accounted for about 10-12 per cent of total production up to the 1980s, and it has further gone up to about 18 per cent in the 1990s.

(b) While rice accounted for most of the procurement up to mid-1960s, the share of wheat in the total procurement increased substantially from late 1960s so that the share of rice and wheat remained more or less the same during the 1970s and 1980s. However, there is a slight improvement in the share of rice in the 1990s. In terms of the share of procurement in the production of each crop, a higher percentage of wheat production was procured by government agencies in comparison to the share of rice.

(c) In terms of regional contributions, over the years Punjab has emerged as the major contributor of both rice and wheat.

Source: Centre for Monitoring Indian Economy, India's Agricultural Sector, September 1995, p 37. (d) Procurement methods have undergone various changes over time. While there had been levy on farmers, traders and millers, and also movement restrictions during certain periods, now most of these restrictions are somewhat relaxed. In view of the restrictions, sometimes the procurement system has been characterised as coercive [Dantwala 1993]. However, as Dantwala has pointed out, there is no coercion for wheat purchase, but the levy on rice millers and traders had some element of coercion.

(e) Procurement price: While in the early years the support prices and procurement prices were announced separately, of late the distinction between these two prices has disappeared so that the procurement price decisions are often influenced by the farm lobbies of the surplus states [Radhakrishna and Rao 1994; also Mitra 1978, Raj Krishna and Ray Chaudhari 1980]. A companson of the procurement price and cost of production of wheat and paddy in Punjab (Table 3) indicates that the procurement price has provided adequate guarantee of returns over cost to the farmers. In the early years of the green revolution, the margin between the procurement price and cost of production of wheat was more favourable to the farmers than the corresponding margin for rice. However, with greater adoption of high yielding varieties of paddy the difference in the margin between paddy and wheat has somewhat narrowed down.

(f) Dantwala has analysed the contention that procurement at below market price amounts to indirect taxation on farmers. According to him, the procurement system followed for wheat has arrested the decline in prices below the support price level. In the case of rice, when certain quantity is withdrawn from the market as levy, the market price for the remaining quantities would be higher than the open market price in the absence of levy. The weighted price of levy rice and open market price under levy was expected to be higher than the open market price in the absence of levy [Radhakrishna and Indrakant 1987; Subbarao 1978]. Thus, there is a strong view that procurement price did not provide any disincentive for the farmers. Further, there

is a view that the guaranteed favourable price level has improved the adoption proces of new technology which in turn has contributed to substantial growth in the private investment in agriculture [Tyag 1990]. The relatively high seasonal price stability has also changed the seasonal pattern of market arrivals.

IV Food Distribution

Foodgrains are distributed through inetwork of fair price shops spread all ove the country. It was visualised that a fair price shop should be available for 2000 persons In 1995 there were about 433 thousand fair price shops of which about 330 thousand were located in the rural areas. The area covered by the Revamped Public Distribution Scheme (RPDS) initiated in 1992 with a coverage of about 1750 blocks account fo about 102 thousand fair price shops.

The quantities supplied through the PDI outlets remained below 5 million tonnes up to 1963, and it had gone up to 14 million tonnes by mid-1960s. Throughout the 1970 the quantities remained around 10 million tonnes, and during the 1980s, the average was around 16 million tonnes. The offtake from the PDS outlets reached a peak leve of 20.8 million tonnes in 1991 and then it has somewhat declined to about 15 million tonnes in 1995. The following observation can be made about offtake from the PDS

(a) During the last few years, the allocation to the states for distribution through PD: has been around 11-12 million tonnes of ric and 9-10 million tonnes of wheat. However from 1992-93 onwards, the offtake indicate a decline. Between wheat and rice the declin in offtake was more pronounced for wheat than for rice. The data relating to allocation and offtake of rice and wheat for the lastive years are available in Table 4.

(b) Studies on PDS offtake have indicate that offtake was influenced by availabilit factors and the price differential betwee open market price and PDS price [see Georg 1983]. During the 1990s, production of foodgrain has been somewhat stable. Is uprice of rice and wheat had been revised for times between 1990 and 1994 with the resu that the 1994 price level was more than double the price in 1989 for rice and nearly double the 1989 level for superfine rice and wheat

The frequent increase in the issue pric has narrowed the gap between the ope market price and the price charged fo supplies through PDS. This narrowing pric differential together with easy access in the open market might have influenced the log offtake.

(c) With increased procurement an reduced offtake from the PDS the foodgrai stock in the central pool has reached somewhat high level. The shift in the season pattern of market arrivals has also transferre

some amount of stocks from the farm level to the government procurement agencies. The stock level in July 1995 was 35.6 million tonnes (16.4 million tonnes of rice and 19.2 million tonnes of wheat). While the actual stock of wheat and rice had been below the minimum norms for most periods up to April 1993, during the subsequent periods, the

actual stock had been far above the minimum requirements.

A number of measures such as release of subsidised wheat to Modern Food Industries India for supply of bread at reduced prices, supply of subsidised food grains to hostels mainly occupied by backward categories, mid-day meals scheme for the benefit of students enrolled in primary schools, and open market sale of wheat and rice by the Food Corporation of India were initiated during 1994 and 1995. In spite of these measures, the stock position continued to be well above the required minimum level.

(d) The major criticisms of the distribution system relate to three aspects: (1) there is a sectoral bias towards urban areas; (2) there is a regional bias; and (3) the leakage in the system introduces class bias especially when it does not provide food security for the poor class. From a historical point of view, it is true that in the 1960s and 1970s, the coverage of PDS was largely confined to major cities and a few states. However, using data available from the 42 round of NSS, Dev and Suryanarayana (1991) have indicated that for most of the states, with the exception of West Bengal, the urban bias may not be present. Based on certain criteria they have concluded that the PDS is rural biased at the all-India level for rice and coarse cereals. On the question of protecting the poor, both in the rural and urban areas the poor depended on the open market for a large share of their foodgrain purchases than the PDS. Further, there was no significant variation in the level of dependence on the PDS among the different income groups. Other studies also have concluded that a larger share of the benefits from the PDS accrues to the upper income groups [see for example Jha 1991]. However, in the absence of adequate empirical basis regarding the outcome of the efforts made on targeting the PDS to the backward regions and poorer segments of the population, it is rather difficult to judge if the situation has improved or not

(Retonne)

#### V Food Subsidy

The food subsidy has two components one representing the consumer subsidy and the other relating to the cost of carrying buffer stock. The government of India fixes the procurement and issue prices of foodgrains handled by the Food Corporation of India. Often the difference between these two prices is not sufficient to meet the handling cost of the Corporation, and therefore the government reimburses the difference between the economic cost and the issue price to the FCI as consumer subsidy. The Corporation also maintains the buffer stock of foodgrains and the government reimburses the buffer stock carrying cost to the Corporation.

During 1972-73 the total food subsidy was Rs 117 crores which has increased to Rs 662 crores by 1980-81. From the 1980s the amount of subsidy has gone up at a rapid rate to Rs 5,250 by 1995-96. During the 1970s consumer subsidy accounted for about 55 per cent of the food subsidy. However, during the 1980s, the share of consumer subsidy in the total food subsidy has gradually increased up to 90 per cent by 1989-90. However, by 1993-94, the cost of butter stock operation has also increased so that the share of consumer subsidy in the food subsidy has declined to about 72 per cent (Table 7).

The total consumer subsidy depends on the quantity of foodgrains distributed through the PDS and the rate of subsidy which in turn is determined by procurement price, handling charges of the Food Corporation of India and the issue price. It was already pointed out that the offtake from the PDS has witnessed a gradual increase during the 1980s. Until mid-1960s, the consumer subsidy was mainly incurred on wheat only and subsequently the subsidy was incurred on both rice and wheat. Throughout the 1970s the rate of consumer subsidy on wheat was more than the subsidy rate for rice, and in the 1980s the position was reversed. However, during the 1990s, the rate of consumer subsidy on wheat has again crossed the rice subsidy rate (Table 8).

The rate of consumer subsidy is influenced by procurement price, handling charges and issue price. The pattern of changes in the procurement price and issue price have been already indicated. The handling charges include the procurement cost and the distribution cost. The changes in the handling cost indicate that it has gone up from Rs 145.7 per tonne during 1974-75 to about Rs 1,800 per tonne during 1989-90 and to about Rs 1,800 per tonne in 1993-94. The breakup of the handling charges between procurement cost and distribution cost for 1989-90 to 1993-94 is available in Table 9.

The cost of carrying buffer stock is influenced by the size of buffer stock and

the charges for various items such as storage, handling, interest on capital, administrative overheads and storage loss. An analysis of the cost incurred on these items indicate that interest on capital accounted for the major share of the cost of carrying stock and the storage charge was the next important item (Table 10).

#### POLICY ISSUES

The brief review of the PDS indicates a number of policy issues for further consideration. In the absence of careful studies on some of these aspects, here it is proposed only to raise some of these aspects for further discussion, rather than specifying a preferred policy alternative. For convenience, the various policy issues are grouped under three broad categories of PDS coverage, production incentives and food subsidy.

#### COVERAGE

The policy statements on PDS coverage are essentially based on the assumed role attributed to it. Often the coverage related roles attributed to PDS include food security, avoiding distress purchases, equity in distribution with respect to income inequality and regional inequalities. Depending on the specific roles attributed by the analysts, there have been differing views on the relative success or failure of PDS. These observations relate to the fulfilment of the main objective of providing food security to the poor, inherent urban-bias, leakage to the non-poor and interstate variations in the coverage of population below the poverty line [see Dantwala 1993; Tyagi 1990; Dev and Survanarayana 1991: Jha 1991: George 1979]. The adequacy or otherwise of the offtake from PDS can be determined only after clarifying the objective of the PDS and estimating the desired offtake to fulfil this objective. Therefore mere observations based on increase or reduction in offtake at a given period cannot be interpreted as fulfilment or otherwise of the PDS objective. Based on various considerations often it has been suggested that the scope and coverage of PDS should be limited to providing food security to the vulnerable segments of the population. If this suggestion has to be followed up through specific measures, it is important to identify the target group, determine the quality entitled by each household, specify the consumer price level and evolve measures for minimising leakages of both types (similar to type 1 and type 2 eriors in the testing hypothesis). If the objective of the PDS is specified in relation to a specific target group, issues such as rural-urban bias or rich-poor bias may turn out to be non-significant since the performance will be judged against tulfilment of the target. However, irrespective of how the target is defined, there are still valid policy questions relating to specification of the mode and mechanism for serving the target group and minimisation of the leakages. The measures suggested for achieving these include linking up PDS with food for works programme, limiting the supplies to coarse/inferior quality grains, restricting distribution in backward regions, and public participation in identification and distribution of food. Yet another alternative suggestion relates to dismantling the whole distribution mechanism and providing entitlement to the target group through food stamps along the pattern followed in some countries.

#### PRODUCTION INCENTIVES

The PDS, as operated in India, has procurement as an important component. It was visualised that a meaningful production programme should ensure a minimum support price to the farmers which becomes the floor price during periods of bumper harvest. The support price, normally announced during the early part of the crop season was expected to influence the farm level decisions regarding the allocation of land and other resources among different crops. After the harvest, the actual

Notes Neg Negligible; @ Net availability = Net production + Net imports changes in government stocks, # includes quantities released under the Food for Work Programme during the years 1978 to 1990.

Production figures relate to agricultural year: 1951 figures correspond to 1950-51 and so on. Figures for procurement and public distribution relate to calendar years.

Sources: 1 Ministry of Food. 2 Directorate of Economics and Statistics, Department of Agriculture and Co-operation. procurement price was expected to be specified on the basis of various considerations. However, as mentioned earlier, the distinction between the support price and procurement price have been eliminated and for all practical purposes the procurement price in a given year is treated as the support price for the following year. Though there have been some disagreement regarding the adequacy of incentives and the inefficiencies in resource use, it is true that the procurement operations have provided some price incentives for farmers to enhance foodgrains production, especially through switchover to high yielding varieties [Schultz 1968; Lipton 1975; Dantwala 1967; Parikh 1992; Pursel and Gulati 1993 and Rao 1992]. Though there is a view that the coercive nature of procurement has introduced some loss of farm income, it is not possible to overlook the fact that market fluctuations in farm prices have been reduced, especially in the surplus states and this has in fact provided a certain degree of production incentive. However, there are indications of a strong relationship between procurement price and market price, and that procurement operations beyond the PDS requirements have induced a transfer of a food subsidy to the producers. In this context it is useful to analyse if the support price operations for providing production incentives should be directly linked up with the public distribution arrangements. Though the mutual dependence has certain advantages, it can be visualised that these two activities can be considered in isolation. Further, the output price is only one of the production incentives, and from a policy perspective it can be considered along with other options such as input subsidy. Utilisation of the amount spent on food subsidy for infrastructure development (for example irrigation) is another suggested option for increased output.

### FOOD SUBSIDY

As indicated earlier, the amount of food subsidy depends on a number of factors such as procurement volume, PDS offtake, storage levels and efficiency, gap between issue price and procurement price, handling efficiency of the various organisations and interest charges. In the context of general discussion on reduced food subsidy a number of suggestions have been made. These suggestions directly or indirectly involve one or more of the following measures: (1) restrict the volume handled through PDS by means of effective targeting and reduced leakages; (2) match the procurement, both in terms of commodity composition and volume, with distribution targets so that storage levels can be controlled; (3) increase the efficiency of handling operations, especially the operations of the Food Corporation of India.

While all these suggestions are consistent with the available empirical evidence, the administrative and organisational mecha-

nisms to implement these suggestions are somewhat clusive. In the absence of suitable machinery to implement these suggestions, it is rather difficult to visualise how food subsidy can be reduced while retaining the current mechanisms. In this connection it is useful to consider a functional separation of the various activities currently handled in connection with the public distribution system. Though there are certain vital links among these functions, it is important to realise that the accountability and operational efficiency can be brought under meaningful control if they are separately managed by independent decision-making processes. The procurement operation under support price obligation and procurement for PDS are essentially two activities and it is improper to account the cost of maintaining support price as a food subsidy. While the quantities obtained under support price operations would definitely ease the procurement burden of the PDS organisation it is not necessary that these two should be exclusively tied up. If the procurement operation under support price obligations is handled independently, it will be possible to judge the efficiency of the operation. It could also be possible to minimise the subsidy element in this operation through a support price fund with contributions from both the government and the producers. Similarly the storage operation can be managed independently within the broad guidelines regarding the minimum storage requirements. The distribution agency may obtain the supplies from the procurement agency or from other sources at competitive prices. The bifurcation of these three functions under autonomous decision-making units would introduce some degree of efficiency and accountability. In order to implement this, it is not essential that the FCI should be dismantled, but it is important that the operations are reorganised and sufficient autonomy provided for each unit for independent decision-making within the broad policy framework. However, the bifurcation of the functions could take care of only the second and third set of measures mentioned above and the first measure regarding proper targeting should be handled simultaneously through effective administrative arrangements.

### Notes

[Paper presented at the National Seminar on Agricultural Development Perspective for the Ninth Five-Year Plan, IIM, Ahmedabad, June 13-15, 1996.]

- 1 Arthasastra recommends effective public action through food subsidies as the basic remedy for famines. The suggested measures include distribution of seed and food from the royal store on concessional terms and food for work programmes for building forts, irrigation work, etc [Rangarajan 1992].
- 2 The other elements included a production strategy withemphasis on the use of new technology in areas of computative advantage and a price support backed by food procurement operations.

3 Ine wholesale price index of all agricultural committees has increased by 74 per cent during 1989-90 to 1994-95.

## Women's Employment in Newly Industrialising Countries

Jeemol Unni

Women and Industrialisation in Asia edited by Susan Horton; Routledge, London, 1996; pp 314 + xix, £ 50.

WOMEN's participation in the labour force has been increasing in most countries in the last few decades. The increase in women's participation in Asia is, however, less marked than in the industrialised countries and Latin America. Within Asia, while women's participation has clearly risen in South Korea, Indonesia, Philippines and Thailand (through rural participation rates declined in the latter), the Indian case is marked by relatively low and stagnant female participation in the workforce. The Indian case is similar to the development experiences of other countries. in the shift out of women workers from the unraid family worker status to that of employees. However, while in most countries women move to regular jobs, in the case of India it is to the less advantageous status of casual workers.

The book under review is an editied volume consisting of eight chapters. In the first chapter the editor provides an overview of the papers. In the remaining seven chapters various authors provide an enlightening review of the changing employment status and conditions of women in mainly East and South-East Asian countries and India These countries are at varying stages of the process of industrialisation. In terms of the proportion of its workforce engaged in industry, India is perhaps the least industrialised of the seven countries.

The seven countries studied are Japan. South Korea, Malaysia, Thailand, Philippines, Indonesia and India. They range from low income developing countries like India and Indonesia to upper middle income developing countries like South Korea, and one OECD country, Japan. Two of the seven, India and Philippines, have had relatively slow growth of per capita GNP over the last 25 years, while the others have had growth exceeding 4 per cent per annum. The book is unique in that few such comparative analyses across countries in women's status in employment are attempted using national labour force surveys. This has also been made posible by adopting a similar format of basic analysis for each country. Of course, differences in methods of data collection and concepts make comparability difficult in any such international comparison.

In the overview, Horton highlights the interesting similarities and differences across

countries. The women's age-specific participation ratios exhibit a 'plateau' pattern in India, Indonesia, Thailand and Philippines. This implies that there is no withdrawal of women from the workforce due to marriage and to fulfil their reproductive role. This is perhaps possible in these four countries due to the predominance of self-employment and/ or perhaps due to the extended family system which continues to prevail. The classic 'double-peaked' pattern is seen clearly only in Japan and South Korea, Malaysia has a somewhat modified 'double-peaked' pattern. Of course, such cross-sectional patterns have to be interpreted carefully since they contain both cohort and life-cycle effects.

Women's employment shifted out of agriculture and into manufacturing, commerce and services over the period studied in most countries. In the course of development there is also an occupational shift away from agricultural occupations to clerical, production and sales activities. Duncan indices were constructed for each country to study the differences in male-female industrial and occupational distributions. The Duncan indices were found to be very small implying very similar distributions, for both industry and occupation across sex in all countries, except Philippines, which was closer to the Latin American case. This is attributed to the higher participation of the workers in these countries in agriculture, irrespective of sex.

Another important dimension, frequently left untouched in labour force studies, which is analysed in this book is women's earnings vis-a-vis men's. The pattern is similar to industrialised countries in that women's earnings tend to decline relative to men's with age, reflecting time spent out of the workforce by women. In Indonesia, Japan and Thailand, where the age-earnings profiles are available over time, they tend to shift upwards. A likely explanation is the narrowing gap in men's and women's education levels during the course of development.

The popular Mincerian earnings functions, derived from the human capital model, have been estimated for the seven countries for two years (data for only one year were available for India). Most studies have used similar explanatory variables, such as age

and education, sometimes marital status. Some studies have, however, included occupation and industry which are potentially more endogenous. While most of the studies have used individual level data from household labour force surveys, the Japanese case has used aggregative published data, whereas the South Korean case used establishment survey data.

The five case studies using individual level data, obtained both OLS and selectivitycorrected estimates. For the latter, participation equations were estimated using mainly demographic variables, which were thought to affect participation but not earnings, to identify the model. The most important conclusion, according to the editor, of undertaking this correction was that this was equally important for men as well as women. Secondly, it also revealed that besides the choice of whether to participate or not, there is also a selection-bias affecting the choice between employee and other employment status, which affects both men and women. The results of the estimation are not discussed in much detail in most of the studies. In general, the standard results are obtained that women have lower returns to age and the classic higher returns to education than men.

The earnings equations have been used to conduct a standard Oaxaca decomposition to examine the components of the malefemale earnings differential. Such a decomposition exercise is expected to decompose the gross gender difference in wage earnings into that part which is due to the differing characteristics of men and women and that which is due to labour market discrimination. Again since this is done for two points in time the change over time is also analysed. In general, the difference in the earnings gap due to differences in male-female characteristics is much smaller than that due to the differences in the coefficients. There is also a tendency for the proportion of the difference due to individual characteristics to decline over time and that due to the coefficients to increase over time. The explanation for the narrowing gap in the former is given as the increase in women's education relative to men's during the course of development.

Horton in her overview does not provide any clear explanation for the interpretation of the differences in the coefficients, including the increase in its proportion over time. In the case of Thailand, Mathana Phananiramai, notes that 68 per cent of the differences, in wage differentials is not explained by differences in the characteristics between men and women. This may be explained by labour market discrimination,

such as sex discrimination in pay or employment. It is also noted that the proportion of wage differentials due to characteristics seems to decline while the proportion due to discrimination seems to increase over time. An interesting inference drawn from this by the author is that "merely accelerating the education of women cannot close the wage gap between men and women".

In the case of Malaysia, it was noted that while women have lower returns to age than men, the returns to education are systematically higher for women. The Oaxaca decomposition showed that relatively little of the earnings gap is explained by differences in characteristics. Differences in coefficients explain the largest share of the earnings gap, in which the effect of the age coefficient dominates implying the effect of experience. The authors draw the confusion that while the returns to education of women are very high the net effect of the education variables in explaining the earnings gap is small. Thus, the implication can be drawn from these two cases together that discrimination of women in the labour market is not necessarily related to the differences in educational levels between men and women. Other labour market and non-labour market factors, such as frequent entry into and exits from the market, also lead to earnings differentials. While universal education and priority to higher education of girls and women is the first step, unless their entry into and retention in the labour market is ensured through other social and policy changes, women's status in the labour market will always remain one step below that of men. It is unfortunate that with such an interesting set of cross country studies the editor has not clearly focused on such overriding concerns.

The study is of course limited by the use of the neoclassical framework of the earnings equation, highlighted above. This prevents the authors from asking certain questions and limits the analysis of wage carnings data to questions regarding experience, education, etc. The question of the change in the distribution of carnings over time, very simply in terms of changes in real wage earnings across sectors and by sex, are not addressed. The fact that data on earnings of the selfemployed workers are not easily available is highlighted. In the overview, the editor recognises the limitation that information on women's work and market earnings does not directly inform us about their welfare. Women's participation may be at the cost of longer working hours/days, inferior quality child care, higher propensity for marital break down, and unhealthy work conditions, which may offset the benefits of obtaining work for higher earnings. She also accepts that the major research gaps are in work on earnings. Besides welfare, issues regarding the standard of living of the workers and their nousenoids are not addressed. In these countries, most of which have been through the economic reforms programmes for 10 to 20 years, an interesting dimension to explore would have been the impact of changes in labour market structure, towards industry and employee status of workers, on the standard of living of the workers.

In spite of the limitations of the framework, in some of the case studies the authors do explore other dimensions. In the Indonesian case, for example, Dwayne Benjamin poses some interesting questions. In Indonesia, participation in the wage labour force and wage earnings have increased in the 1990s as compared to the 1980s. Does this imply that wage income is becoming a more important source of income for households? Its female wage income in particular becoming more important for households? While the share of labour/wage income was rising in Indonesia, the increase was proportionately larger for men. The author concludes that it is likely that women are replacing men on family farms and family enterprises, but whether this reflects discrimination or choice cannot be discerned from these data. In the South Korean study, Moo Ki Bai and Woo Hyun Cho start with a central hypothesis that the Korean labour market is segmented into high wage firms and low wage firms, or sectors. The employment problems of women, such as low productivity and low wages, arise from the fact that women are mainly employed in this low wage sector. In the Indian case study, Sarthi Acharya highlights the growing predominance of women's work in the unorganised sectors of manufacturing industry.

To conclude, in the context of such an inter-country analysis, a number of questions can be raised. Is there any difference in the earnings and employment status of women who enter the manufacturing sector as opposed to the tertiary sector? Some of these rapidly industrialising countries have pursued

a labour-intensive export-oriented manufacturing sector growth. In other countries, where such industrialisation did not quite take off the manufacturing sector growth was eclipsed by the growth of the service sectors. Did the type of industrialisation make any difference to the entry of women in the labour force and her earnings/employment status? The cases studied in this book indicate that even in a country like South Korea, which followed the first path, women entered the low wage sectors. It can be hypothesised that where the women entered the organised sector, either in manufacturing or tertiary sector, their earnings were higher and their status was better protected. Unfortunately, the entry of women has been mainly into the unorganised sectors of manufacturing and tertiary services, so that their employment and earnings status has been mainly lower than that of men.

The implication of this is that while education is a major factor influencing women's employment status, there are many other economic, social and political factors which play important roles. One such factor is the tightness of the labour market or the demand for labour. However, given demand, government policy towards female labour and the household organisation which may release women for work outside the house, play crucial roles. If government policy is conducive, it would provide state sponsored child-care centres and skill training to upgrade the quality of female labour to facititate women's entry and upward mobility. There is, therefore, an inter-play between labour demand, government policy and household organisation which affects the way labour demand eventually affects female employment. While such an analysis may have been outside the scope of this book, it would definitely help to understand factors influencing women and industrialisation which are beyond the pure economic framework.

### SECULARISM: SOCIO-LEGAL ISSUES

S N. DHYAN

The book, which is basically a response to the politics of religion, begins with an analytical exposition of the genesis and evolution of the concept of secularism as it has been conceived, understood and accepted in India and the West. Then, in order to discover and understand the Muslim psyche on the issues elated to secularism, the Islamic theology, jurisprudence and Shariah have also been studied.

It gives an insight of judical version and interpretation of secularism in a critical and constructive manner.

### Sukumari Bhattacharji

Society and Religion from Rigveda to Puranas by Gadkari, Popular Jayant Prakashan, Mumbai, 1996; Rs 350.

ANCIENT Indian history - social, religious and cultural - is a happy hunting ground for many authors. Today the craze is more noticeable because many authors of a particular political complexion have an axe to grind and the subject offers them an opportunity to twist the existing data in order to propound their theories. Ancient Indian history is a very handy peg on which one can hang chauvinism, fundamentalism, seemingly innocuous vested political interests and presentation of warped social values. The stated aim of some of these authors is to re-interpret ancient Indian historical material, but research or cultivation of history is really of secondary importance, the ulterior motive is to select, reject and present data suitable to their perspective and frequently this is the glorification of the reactionary elements in Indian history.

When the atmosphere is so vitiated, it is a relief to find a book like the present one. The author, a lawyer by profession, has studied ancient Indian history painstakingly and has taken the trouble to write a book on the subject. He starts from the Rigveda and analyses literature from which he culls the relevant historical material and concludes with comments on the socio-economic situation.

Gifts to officiating priests mentioned in the latter part of the Rigveda prove the beginning of the convention of sacrificial fees paid by the sacrificer to the priest and a list of the various items of such gifts includes horses, camels, chariots, bulls, cows, women, slaves with ornaments, even a carpenter (vi. 45). These clearly indicate the production of surplus which accumulated in the hands of some tribal chiefs. From this stage to the rise of oligarchies was but one step "... as surplus grew the tendency to appropriate the same also grew among the victorious and powerful leaders of the tribes, who virtually became the ruling cliques" (p 19). The author takes into consideration a very important fact, the hostility, rivalry and clamour for supremacy between the brahmins and the kshatriyas, something like the conflict of church versus state in medieval Europe. Since the Brahmana Granthas were written by the priesthood, it is quite likely that the brahmanas have elevated themselves to a higher position than they actually enjoyed" (p 45). Quite a valid hypothesis. not proposed by most previous scholars. Exploitation of the vaishyas and shudras by brahmins has been substantiated with textual evidence. The growth of larger territorial states from the emergence of towns which depended on contiguous areas of peasant and craftsman habitation for the supply of the daily necessities of the townpeople has been shown. With this there was a parallel process of commingling of various religious sects, beliefs and practices, the resulting syncretism of faith and worship has been traced briefly but convincingly.

Socio-economic growth and expansion led to the rise of monarchies which again necessitated a standing army comprising vaishyas, shudras and men from defeated tribes and communities. In this context the author makes a very pertinent point: "With the change of functions, these new incumbents could not have continued to belong to their original place in four-fold varna division and therefore, the new sections of arms-wielding people must have become entitled to be recognised as kshatriyas in course of time" (pp 67-68). How the older varna division was going through radical change, how the changing economic and political needs forced a permutation and combination of the various castes has been shown effectively. Similarly, the process of the formation of guilds broke down the social barriers of tribes by craftsmen "coming together after breaking down or overcoming the tribal barners" (p 68). A little later he comments on caste miscegenation (sankera) describing it as a "perverse distortion of the real social process taking place in the territorial expansion of a common society comprising diverse tribes and cultures" (p 70).

While society had grown in size, territory and complexity of political organisation, there came a time when religions assumed an unwarranted importance. The growth and diversification of knowledge was arrested. This led to a kind of ossification of the social fabric and an insularity in the conceptual world. " .. the knowledge of the complex technicalities and contrived procedures of the yajna ceremony of the Brahmana Granthas was considered to be Vedic knowledge during this period, while the knowledge of crafts, arts and physical labour was reduced to subservient position. The non-producing upper castes were thus able to create an inferiority complex in the masses which were the direct producers" (p 77). Thus began a reverse process of aban-doning the vitally important subjects at the cost of which the so-called Vedic lore prospered. Sacrifices multiplied together with the number of priests, the expense skyrocketed removing the whole liturgy beyond the means of the common man who slowly receded to the outer periphery. There arose the non-orthodox schools of fait — Buddhism, Jainism and various other non-conformist sects.

Meanwhile, with the proliferation of the sutra literature, reactionary values gradually gained ground. Kings, priests, the nobility were worshipped; the shudra and the woman came to be regarded as sub-human. With the moving away from ritualism there arose the abstruse tenets and discourses of the Upanishads which still enjoy an aura, a charisma of a superior order. The author's analysis is worth quoting "... the priesthood desired to convert the [Upanishadic] concept into such an incomprehensible mass of mystery as to inspire fear and awe, and eventually, a feeling of inferiority among the lay people. This was the only way in which the class superiority of the priesthood could be maintained" (p 89). This was so especially in view of the fact that with the peoples' disaffection with liturgical religion, the priests lost the seats of honour and deluding the people with their possession of some superior arcane knowledge was the only way in which they could claim awe and homage of the common people, "The Upanishadic concept of avidya developed from the negative idea of mere ignorance to the positive idea of false knowledge" (p 92). Existential experience rests on plurality of substance, but Upanishadic monism denies plurality and upholds one single entity, Atman-Brahman.

Buddhism, a godless religion "was revolutionary because it proposed a cause and effect relationship behind every worldly phenomenon, thereby inspiring a spirit of enquiry into them. The mysticism of the Upanishads, on the contrary, closed the doors on the possibility of such investigation" (p 106). No wonder, then, that Buddhist logic reached the highest peak of logical enquiry. Then again, Buddhism envisaged a more egalitarian society, "the sanghas symbolised classless societies within the fold of class societies. The Buddha's sanghas were designed on the basic of the rules of equality in the pre-class tribal societies" (p 112). In the final analysis, however, the author states that "though the basic tenets of Buddhism were contrary to brahmanism, the rulers, as well as laymen were able to accept or at least respect, both the faiths without rancour or confrontation" (p 141).

With the rise of the non-conformist sects the machinery for extortion spread; while earlier it rested with the monarch, now the rising nobility of merchants who introduced mortgage, interest, usury, confiscation enjoyed the cream of the surplus produced by the peasants and artisans.

The author treats of two texts of cardinal importance in shaping Indian society -

Kautilya's Arthashastra and the Manusmriti.
Some of Kautilya's dictums commend him
he has a realistic and scientific approach
to society, he fully realises the significance
of material wealth, its protection, utilisation
and the means of increasing it as well as its
investment for public welfare. In social laws
Kautilya approves of a woman forsaking
her husband in six extreme situations—a
liberalism never found again among the later
law-makers.

The Manusmriti, later by over half a century than the Arthasahstra, betrays tendencies to greater rigidity regarding the control of the weaker sections of society with an iron hand. A work of the Kushan period, it grew and covered large territories of northern India at a time of greater material prosperity when wealth was accumulating in the hands of a privileged few. Trade guilds grew in power and after the decline of the Maurya dynasty, they gained a measure of independence. Intermarriage among members of the guilds reshuffled the caste organisation and many new subcastes emerged and were recognised. "...the new brahmana class, especially the vratyas, spread while building up a multi-caste heterogeneous society, and religion with a multiplicity of gods, along with the advance of the plough agriculture in the new regions also spread" (p. 151). Syncretism became quite prominent in the rise of the new religion which has evolved into what is known as Hinduism today. But the Manusmriti "is remarkably consistent in harping upon the perpetual and absolute inequality among human beings and proclaiming the superiority of the brahmanas" (p 155).

The next set of formative texts are the Puranas. Unlike the Vedic texts these are open to shudras and women. The Puranas together with the two epics are the authentic scriptures of Hinduism and they reflect a great upheaval in the religion - puja (idol worship), vows, pilgrimage, charity, devotion, etc, emerge as new values. "This was the result of unprecedented development of agriculture-based society among the new communities which were idol-worshippers" (p 181). Shaivism and Vaishnavism came to the forefront and innumerable sub-sects rose with the passage of time. Pilgrimages indirectly led to the diffusion of knowledge and a conceptual unification of India.

In the epilogue the author gives a brief resume of the arts, crafts, literature, astronomy, mathematics and ends with a section on untouchability. On the last subject the author submits that people did not become untouchable because of the filthy nature of their jobs, but filthy jobs were forced on the undesirable sections of the people, viz, captives and subjugated people who were not slaughtered because the spiritual climate of the country was saturated with non-

violence. This is a better explanation of the phenomenon of untouchability.

The author has a pleasant style with a smooth flow of the prose which makes the book eminently readable. He is logical in the arrangement of the material and the range of his reading is quite wide, not only on Indian history but also in allied fields. All this renders his presentation convincing.

There are, however, some errors, many of which are grammatical oversights and some in transliteration of Sanskrit words into English. Sudas has been consistently rendered as Sudasa, 'kamabadhya' is not to be 'beaten' but 'killed' at pleasure (p 47), 'takman' is malaria, not cold fever (p 55), 'gomata' should be 'gomat' (p 9), 'bruhi' is in the imperative mood and means 'speak', not 'I shall speak' (p 73), 'pratyagatman' has been rendered as 'prainvatman' (p 89. 133), 'sanctimonious' is used for 'sacred'. Valmiki is 'a savage robber' (p 181) only in the late 16th century Bengaly translation, in the original he is an ascetic. 'Aapurta' has consistently been rendered as 'purta', Tvastri as Tashta, 'havis' does not mean 'share' but 'oblation'. Minor errors like these are quite frequent but the real hurdle lies elsewhere: except very occasionally, the author does not place his historical material in time. Texts, socio-economic phenomena, ritual practices

philosophical tenets are mostly arranged in sequence but without reference to any time-frame. In a book on history this is a serious blemish. But all can be easily rectified in the next edition. These errors are mentioned because materialist explanation of Indian history is the crying need of the day, but such authors swim against the tide and have to be doubly careful in their data before they can convince the readers. We have to run twice as fast to reach half as far.

The basic conclusions of the book are sound. When many historians seek to twist history to prove cosy theories like 'Indian society had always been closely knit', 'shudras were comfortably accommodated in society', 'women have always been respected and accorded an equal status', 'untouchability is a rare regional phenomenon confined to small pockets', 'the Indian people have always been too inclined to religious life to be concerned with material prosperity', when all this is the prevalent trend, a book like this is most welcome. It demythologises Indian history, uncovering the selfish and wilful imposition of poverty and loss of human dignity on the masses by a handful of privileged people, much of whose religion, philosophy and scriptures are deliberately planned for the suppression of the majority of the people so that their own vested interest is not harmed.

# PUBLIC POLICY ANALYSIS AND DESIGN

Editor
V. K. AGNIHOTRI I.A.S.

Hardbound

Rs. 700

A Seminar on Public Policy Analysis and Design was organised by LBS National Academy of Administration, Mussoorie in the context of the increasing concern for public policy. It was structured around two themes with a view to explore certain sectoral policies and, more importantly, to demonstrate the utility of certain methodologies, already available as well as recently developed, for public policy, analysis and design. The book provides a wide coverage of public policy issues from different perspectives.

V. K. Agnihotri is Joint Director and Coordinator of Public Administration Faculty, Lal Bahadur Shastri National Academy of Administration, Mussoorie.

# Public Sector Enterprises in India Is Privatisation the Only Answer?

### K P Kalirajan R T Shand

Privatisation is a major theme in public sector reform. This article argues on the basis of empirical evidence that improving the performance of public enterprises is an alternative measure where privatisation is a difficult policy option to implement in the short term. A bench-mark for measuring productive performance of public enterprises has been evolved and applied to measure productive performance and production behaviour.

A VIEW, often cited in the literature, is that public sector enterprises are inefficient and should be handed over to the private sector. This has made privatisation a central theme in public sector enterprise reforms. But we argue that the most important questions that should be addressed in such reforms are why they are inefficient and what reform measures should be implemented to make them efficient. Answering these questions and directing reform measures towards improving performance is an alternative path in conditions where privatisation is a difficult policy option to implement in the short term. It could also be regarded as a pre-condition for privatisation.

There are contrasting views on privatisation in the literature. One insists that private ownership ensures the necessary qualities of motivation and incentive in decision-making and implementation which are lacking in the case of public ownership [Hayck 1944 and Kornai 1986]. Examples can be cited to illustrate the existing inefficiency in public sector enterprises in many countries. The other view argues that private ownership is not the sine qua non for improving motivation and incentive to produce maximum possible output. Eliminating the 'soft budget' approach to public enterprises is the most important factor towards improving the productive performance of public sector enterprises [Bardhan 1992]. The example cited most often in the literature in this context is Singapore where there are a large number of efficient pubic sector undertakings. However, there is a major difference in the composition of public sector enterprises in Singapore and in India. Sick and loss making firms will not be considered for public sector ownership in Singapore, whereas they constitute a major proportion of such enterprises in India. An important question addressed in this paper is that of the impact of 'soft budgets' on the productive performance of Indian public enterprises.

It is customary to gauge the performance of any business undertakings by the yardstick

of net profits. Given that the public sector has different objective functions from the private sector and that 'soft budgets' play a crucial role in public enterprises, measuring their performance in terms of profits may not be meaningful. A measure of performance should be defined which is independent of whether firms are subject to 'soft budgets' or 'hard budgets'. In this paper, a bench-mark is chosen for measuring the productive performance of public enterprises, and the objective is to compare the realised performances of public enterprises in India in relation to that measure.

The following section briefly discusses the inter-relationship between 'soft budgets' and productive performance of public enterprises, and provides a brief description of the public sector in India. The next section explains the chosen bench-mark chosen for the empirical analysis and the estimation methods used. With a brief description of data, empirical results are analysed in the following section. A final section brings out the overall conclusions of this paper.

### 'Soft Budgets' and Public Sector Enterprises

Budget constraints in public sector enterprises, generally, are unduly soft, and political accountability prevails over performance accountability. Performance accountability requires that resources are not wasted and are used to their full capacity. A necessary condition for performance accountability, therefore, is that firms should not enjoy 'soft budgets'. In Kornai's (1980) terms, 'soft budgets' refer to the following elements of the economic environment faced by firms: subsidies, favourable administered prices, easily arranged tax reliefs, and easy credit availability and repayment. Kornai (1986) has elegantly explained how the 'soft budgets' environment influences production performance of public sector enterprises, so the arguments are not repeated here, but briefly, 'soft budgets' usually allow firms to produce outputs by using inputs liberally and not use them to their full capacity. This means that 'soft budgets' tend to encourage such firms to waste scarce resources. In other words, 'soft budgets' discourage competition and consequently, reduces productive efficiency. Competition is always associated with the private sector in the literature, but there are no valid theoretical arguments as to why competition cannot be associated with the public sector, once 'soft budgets' are climinated

The important question in this context is how far 'soft budgets' have constrained public sector enterprises in India from achieving best possible productive performance without wasting resources. To the extent that they have, it is logical that public sector reforms should aim at improving productive efficiency as a first priority, and this can be regarded as a necessary pre-condition for engendering interest in the private sector to buy public sector enterprises.

As a consequence of the Industrial Policy Resolution of 1956, public sector enterprises in India have played a strategic role in the economy. Key sectors of the economy are dominated by public sector enterprises in terms of employment generation and productivity levels. The public sector in India comprises of the following three types of organisations administration by a government department; the joint-stock company governed by company law and controlled by the government as the principal chareholder, and autonomous public corporations. In the 1950s, there were only 21 public sector enterprises with an invested capital of Rs 81 crore. In the 1960s, the number of enterprises and the invested capital grew to 85 and Rs 3,902 crore respectively. In the 1970s, the number of enterprises doubled to 169, and the investment quadrupled to Rs 15,534 erore. The increases accelerated in the 1980s, numbering 244 and Rs 99,329 crore respectively [Department of Public Enterprises 1993].

A major reason for this rapid and accelerated expansion is that public enterprises spread to all areas of the economy. Table 1 indicates the growth in value of sales in public sector enterprises in manufacturing and service sectors. Both manufacturing and service enterprises have consistently increased their value of sales. However, sales value as a percentage of capital employed has declined continuously from 1985-86 to 1991-92. In fact, the general overall performance of the public sector enterprises has deteriorated over time, with an increase in the number of loss-making enterprises.

It is customary to gauge the performance of any business undertaking by the yardstick of net profits. Given that public sector enterprises have different objective functions from private sector enterprises and that 'soft budgets' play a crucial role in such enterprises, measuring their performance in terms of profits may not be meaningful. A measure of performance should be defined which is independent of whether firms face 'soft budgets' or 'hard budgets'.

One such measure uses the ratio of realised output to potential output, given a set of inputs and technology. This is referred to as technical efficiency in the literature. Thus, firm-specific potential measured as maximum possible output for a given set of inputs forms a bench-mark from which the productive performance of the concerned firm is measured. To avoid wastage of resources, the central objective of enterprises, whether private or public, should be to produce the maximum possible output from a given set of inputs and technology. Maximum possible output is achieved, when an enterprise follows the best practice techniques of the chosen technology. Therefore, in public enterprise reforms, the central focus should be on the question of whether or not enterprises are following the best practice techniques of the chosen technology.

### II Bench-Mark Specification

The bench-mark of the potential output can be defined in terms of the following stochastic frontier production function [Kalirajan and Shand 1994]:

$$y_{ij}^* = f(X_{ij}) \exp(V_{ij})$$
 (1)

where f(x,t) is the appropriate production function,  $y_{it}^*$  represents the maximum possible production level with given technology of the i-th firm in the t-th time period, and  $x_{it}$  is a vector of core inputs used in production. Variable  $y_{it}^*$  is obtained by the i-th firm in the t-th period from the input set  $x_{it}$ , using the best techniques available from the given technology,  $v_{it}$  is a random

variable which is assumed to be normally distributed independently of input vector  $\mathbf{x}_{it}$ . Due to the presence of the random variable,  $\mathbf{v}_{it}$ , this equation represents a stochastic frontier. Further,  $\mathbf{v}_{it}$  is expected to capture the influence of factors outside the control of enterprises that cause the actual output of enterprises to vary around some mean level.

Some enterprises may be producing inside and not on the frontiers defined by equation (1) owing to the negative effects of nonprice or organisational factors. For example, lack of incentives, the soft budget option, poor work ethics, inefficient transmission of information about production processes to government decision-makers, and the ineffectiveness of government control over enterprises<sup>2</sup> could singly or collectively cause deviations of realised output from frontier levels of output. It is very difficult to model the influence of each of the above non-price and organisational factors on output, but the combined influence of these factors can be introduced as shown in equation (2):

$$y_{ii} = f(x_{ii}) \exp(e_{ii}) = f(x_{ii}) \exp(v_{ii} - u_{ii})$$
 (2) where  $u_{ii}$  is a non-negative random variable representing the combined effects of non-price and organisational factors in the i-th enterprise on technical aspects of production in the t-th period. The enterprise fully realises its potential (produces at the production frontier) in the t-th period if and only if  $v_{ii}$  equals zero. This specification implies that enterprises cannot produce more than a theoretically possible level and is more consistent with economic theory than the conventional production function approach. The greater the observed value of  $u_{ii}$ , the further the enterprise will be from the production frontier and less efficiently it will be producing. The level of technical efficiency in the i-th enterprise at the t-th period can now be defined as:

 $TE_{it} = exp(-u_{it}) = y_{it}/y_{it}^{\bullet} = Actual output/$ Maximum possible output (3)

### Estimation Methods

While estimating equation (2), the following three cases can be distinguished for  $u_0$ :

(1) u<sub>n</sub>s remain constant over time or are time-invariant. This means that the distribution of technical efficiency for a

particular period of time is perpetuated in other periods. Furthermore, the efficiency level of each enterprise remains constant over time. Any deviation from the production function results from random shock and not from changes in efficiency.

- (2) u<sub>n</sub>s are correlated over time for a particular enterprise. Under this specification, any variation in technical efficiency will follow a traceable course.
- (3) u<sub>it</sub>s are uncorrelated with other units across enterprises as well as over time. In this case, levels of technical efficiency are determined by the specific production or institutional characteristics of the i-th enterprise during the t-th period of time, and these differ not only across enterprises but over time for particular enterprises.

To estimate and quantify the dynamic characteristics of technical efficiencies of enterprises, the distribution of technical efficiency is assumed to follow case (3) which is probably closest to reality. The specification of u<sub>n</sub> in this study differs from that in previous studies in that the nonnegative component of equation (2) is assumed to vary across enterprises and over all periods following a multivariate distribution. In addition, technical efficiency (u<sub>n</sub>) follows a truncated half-normal distribution and the point of truncation is not predetermined at zero.

In this study, we use the maximum likelihood method discussed in Zhao (1994) to estimate the production frontier. Finally, it should be noted that, despite the advantages of this model, it also has limitations. In particular, the conditionality of the variance of the distribution of technical efficiency on the residual term will not vanish, even if the sample size is increased. Estimations of technical efficiency for individual observations are thus not consistent from a statistical point of view, even though the mean efficiency is consistent.

### III Data and Estimation Results

The estimation of bench-mark and technical efficiency measures for public enterprises in India is based on survey data for 50 manufacturing enterprises published by the Department of Public Enterprises (1993), ministry of industry. Enterprises are from three industries (heavy engineering, medium and light engineering, and transportation equipment). Panel data covering the period 1988-89 to 1990-91 have been used for estimation. Sample data characteristics used for empirical estimation are given in Table 2. All values are given in 1989 constant prices. The means of value added declined by about 9 per cent from 1989 to 1991, while the means of fixed assets increased by about 7 per cent

The following unconstrained Cobb-Douglas model is used to estimate enterprise - specific technical efficiency:<sup>3</sup>

 $\ln (\text{Value added}) = \text{constant} + a_1 \ln (\text{labour}) + a_2 \ln (\text{capital}) + a_3 \text{ Dummy 1}$ 

$$+ a_4$$
 Dummy  $2 - u_{11} + v_{11}$  (4)  
where  $1 = 1, 2, ..., N$  (enterprises);

t = 1989, 1990, 1991.

Economists normally use the time trend as a proxy for technical progress in the estimation of both time series and panel data. It is rational to assume that technical progress may not be significant during the selected period of analysis in India. Maximum likelihood estimation is used to estimate the coefficients of the frontier production functions and the parameters of the distributional form of technical efficiency.

Before examining the production frontier and variations in technical efficiency, it is necessary to check the appropriateness of the generalised stochastic production frontiers where the random variable 'u' follows a truncated half-normal distribution (with an unrestricted mean). This can be tested using a generalised likelihood ratio. The negative of twice the logarithm of the generalised likelihood ratio has approximately Chi-square, with a parameter equal to 2. The Chi-square statistic is 22.8 for equation (4), far exceeding 9.21, the critical value at the 99 per cent confidence interval. This suggests that the null hypotheses is rejected decisively, making model 4 an inappropriate specification for the data set.

The value of 'Gamma' for equation (4) which is obtained in the estimation process is 0.98 indicating that variation in residuals in the production function is explained mainly by variation in enterprise-specific technical efficiency and not by random chance factors (Table 3). However, this conclusion is not valid if the estimated model

is subject to substantial heteroscedasticity. To test for heteroscedasticity, a White's test is carried out by regressing the disturbance term  $(v_i)$  on the core explanatory variables, their squares and cross products. The  $R^2$  is 0.072 with insignificant t-statistics for all variables at a conventionally accepted confidence interval. This means that we cannot reject the hypothesis that  $v_i$  is homoscedastic for the data set.

Equation (4) is used in the estimation of technical efficiency of sample enterprises. All the coefficients are significant at least at the 5 per cent level. The industry dummy variables in the production frontier functions are positive. This means that the production frontier differs from one industry group to another and that the heavy engineering industry has the highest frontier (highest potential output for a given set of inputs and technology) followed by the light engineering industry.

The mean technical efficiency of public enterprises in India indicates that these enterprises were less efficient in 1991 than in 1989 (Table 4). On average, public sector enterprises realised only about 60 per cent of their potential output. Mean technical efficiency at industry level (Table 5) shows a similar trend at this more disaggregated level. This carries the crucial implication that output in public enterprises can be increased without increasing levels of inputs (labour and capital) but just by improving technical and management practices. Medium and light engineering and transportation and equipment industries in India have provided shelter to very inefficient enterprises during 1989-1991.

This does not mean that these industries do not have individually very efficient enterprises. In fact, in the medium and light engineering industry, the most efficient enterprises seem to have been increasing

Notes: H = Heavy Engineering; M = Medium and Light Engineering; T = Transport Vehicles.

their efficiency, as the maximum efficiency level increased to 90 per cent in 1991 from 83 per cent in 1989 and in 1990. Thus there was some dynamism in performance over time.

To gain a better understanding of the productive performance of individual enterprises in each industry, it is a useful exercise to identify the top five efficient enterprises and the bottom five efficient enterprises in the sample. Table 6 shows the top five efficient and the bottom five inefficient public enterprises in India in the selected industries. Our findings coincide almost exactly with conclusions reached by the department of public enterprises based on a number of other performance measures which are published in the Public Enterprises Survey, 1991-92. For example, the 1991-92 Survey argues that the Garden Reach Shipbuilders and Engineers in the transportation equipment industry has shown improvement in shipbuilding, general engineering and production of pumps, and that capacity utilisation was about 100 per cent during the period of analysis. Similarly, the Survey indicates that the Cycle Corporation of India had the poorest performance among the sample enterprises, and that capacity utilisation declined from 25 per cent in 1989 to 16 per cent in 1991. Results in Table 6, using our single performance measure, are in conformity with the above findings concerning these two enterprises.

Thus, the results can be interpreted as an indication that public sector enterprises in India can be made to improve their efficiencies by implementing reform measures directed towards achievement of hest practices (technical performance enhance-

ment) without having to consider the question of privatisation. However, at the other end of the spectrum of technical efficiency, for those firms with very low levels there may be no alternative to closing them down.

### IV Conclusions

This paper argues that technical performance enhancement (TPE) should be the central focus in the first instance in public sector enterprise reform in India. Thus, the more important issue, which has to be addressed quantitatively, is the extent to which individual public sector enterprises are falling short of their maximum possible output from their existing input set and technology. Our empirical analysis shows that a majority of public enterprises have not only failed to achieve their maximum possible (frontier) output, but have declined in technical efficiency over time, i e, have widened the gap from their production frontiers. This means that a huge amount of resources have been and are being wasted. It would be useful and a necessary step to identify the causes for such poor and declining production behaviour, but owing to lack of appropriate data at this time, this analysis could not be undertaken.

Our conclusion therefore is that, regardless of the issue of privatisation, reform measures directed towards raising productivity of the use of existing resources with existing technology can contribute substantially to improving the performance of public sector enterprises. Further, to the extent that privatisation policy for public sector enterprises remains a sensitive issue and difficult to implement in India, implementation of reform policies to improve technical efficiency of enterprises under public ownership by 'hardening' the budget option and using the existing mix of inputs in a technically more effective and productive way becomes all the more attractive. The further key option is to upgrade existing technology

and thereby raise the production frontiers of public sector enterprises.

### Notes

- 1 For a detailed account, see Ahluwalia (1985).
- 2 The latter two problems were identified by Danilin el al (1985) under the so-called 'command economy hypothesis'. These issues, in the context of the Indian public sector, have been discussed by Ahluwalia (1992).
- 3 When a translog form was estimated and the estimates used to test the complete global separability assumption the results showed that the assumption could not be rejected. This means that the underlying production technology may reasonably be represented by the Cobb-Douglas case.

### Political Economy of Privatisation in India

### **Anand P Gupta**

India's biggest failure in its economic reforms programme is that there has not been a transformation of public enterprises. While privatisation appears to be the only way out, it has not made much of a headway. This paper attempts to examine why this has been so specifically exploring the incentives that influence the decisions of India's politicians and policy-makers while dealing with the issue of privatisation of public enterprises.

### I Introduction

INDIA has a huge public enterprise sector. It consists of nearly 1.300 enterprises, owned and managed by the central government. state and union territory governments, and local governments in the country. These enterprises manage, according to the World Bank (1994), as much as 55 per cent of the economy's (excluding households) capital stock and account for one-fourth of nonagricultural GDP. They dominate many sectors of the economy: surface irrigation; water supply in rural and urban areas; railways; river transport; ports; postal services; telecommunications; mining (including hydrocarbons and coal); one-third of registered manufacturing (particularly steel, petrochemicals, capital goods, pharmaceuticals, fertilisers); power generation and distribution; oil and gas production and marketing; air transport; one-third of bus transport; storage; and banking and insurance.

Although there are differences in the performance of individual public enterprises, most are overstaffed1 and suffer from other operational inefficiencies. It is not merely public enterprises such as Bihar State Electricity Board, Uttar Pradesh Road Transport Corporation, Indian Iron and Steel Company, Scooters India, Heavy Engineering Corporation, National Textile Corporation, Fertiliser Corporation of India and Hindustan Fertiliser Corporation, which are inefficient. Even seemingly wellpositioned public enterprises are also operating inefficiently. A study [Gupta 1988] has shown that even Rashtriya Chemicals and Fertilisers, which is considered by many to be one of India's better-run public enterprises, has performed poorly: its pretax profits relative to its net worth ranged between 2.1 per cent and 10.2 per cent during the period 1978-79 to 1986-87, which is much lower than what the government of India (GOI) effectively paid for the resources that it borrowed to invest in it, with inefficiency in the use of inputs (e g. gas and power) being a major factor responsible for this outcome. Similarly, the GOI's National Thermal Power Corporation which received a rating of excellent for achieving its output target in 1991-92, in effect did poorly in that year: output indeed went up, but the use of material inputs rose even faster [World Bank 1995].

Public enterprises have been a major contributor to India's huge public sector deficit - that is, deficit of all public entities in the country, including the central, state, union territory and local governments, departmental and non-departmental public enterprises and public entities such as the Oil Co-ordination Committee. According to a recent estimate [Gupta 1992], the deficit of public enterprises in the energy sector alone adds up to over 4 per cent of GDP. The public enterprises' deficits have added to the country's current large stock of domestic and external public debt (India's external debt, at about \$100 billion, is the third largest among developing countries), which in turn results in massive annual liabilities on account of interest payments - the interest payments of the GOI alone, which has financed much of the investments in the country's public enterprises, as also the losses that many of them have incurred, through borrowings on its account, added up to Rs 520 billion, 4.8 per cent of GDP, in 1995-96. Indeed, the GOI's interest payments currently eat up as much as 46 per cent of its total current receipts,2 up from 39.1 per cent in 1990-91 and 26.8 per cent in 1985-86.

What is more distressing is the phenomenon of many public enterprises in India reporting losses despite being overprotected. This means that these enterprises' operational inefficiencies are so huge that they exceed the benefits resulting from the substantial protection that they enjoy and, as a consequence, they incur losses. With protection levels coming down, with competition increasing, and with many qualified people leaving public enterprises because of substantially better opportunities available in the private sector, the public enterprises' financial performance may worsen.

Many people vehemently disagree with the view that most of India's public enterprises operate inefficiently. GV Ramakrishna, until recently a member of India's Planning Commission, for example, is reported to have claimed that thinking of all public enterprises as inefficient and unprofitable is fallacious, and to substantiate his claim, he is reported to have said that over 131 healthy public enterprises, including those in the infrastructure sector, are making annual profits of about Rs 80 billion (The Times of India, Ahmedabad, January 13, 1995). Two points need to be raised here. First, what is the source of these profits? Is it efficiency in the use of inputs, or protection and/or monopoly or administered pricing? Further, how do the profits compare with what the government effectively paid for the resources that it borrowed to invest in the public enterprises in question? If one evaluates the performance of India's public enterprises in this manner, one will discover that most of them are operating inefficiently as the study on Rashtriya Chemicals and Fertilisers, referred to above, illustrates.

Why are public enterprises in India so inefficient? The answer lies in the environment that public enterprises in India operate in, and in the effect this environment has on the public enterprise managers' incentive: to develop new, better and less expensive products, develop new markets, minimise capital and current costs, and maximise profits. Iyer (1991) provides a graphica account of the unhealthily close and dysfunctional network of formal and informa links and relationships between the government and public enterprises, as also of some of the other components of the environment public enterprises in India operate in. Descriptions which illustrate this environment include: the government's deep involvement in the actual management o public enterprises, with the concerner administrative ministries' tendency to function as if they were a kind of super management on top of the Board o Directors;4 parliament's involvement in public enterprises' affairs in several ways including through numerous questions and enquiries ranging from questions of overal performance and policy issues to the minutes details of day-to-day functioning; and expansion of the horizon of Article 12 o the Constitution to treat even industrial manufacturing and commercial publi enterprises as 'state' and thereby subject them to the various obligations that go wit such a treatment.

Some people believe that the performance of India's public enterprises can be substantially improved. They assert that what India urgently needs is the putting in place of a programme of public enterprise reform which, among other things, will have to include reform in government at both the political and bureaucratic levels. An objective assessment of the situation however suggests that public enterprise reform in India is not possible.

A recent study [Kikeri et al 1994] has documented what public enterprise reforms in a number of countries have aimed at and the problems that they have faced. The reforms aimed at exposing public enterprises to domestic and external competition and level the playing field by eliminating easy access to credit both from the budget and the banking system; by freeing public enterprise managers from non-commercial goals and government interference in dayto-day decision-making; and by developing institutional mechanisms, such as contract plans (or MOUs) and performance evaluation systems, to hold managers accountable for results. In response to these reforms, some public enterprises have indeed performed better, but three problems persist. First, the reforms are technically and politically difficult to implement. Often, well-designed programmes have fallen short in implementation

Second, performance does improve when the full reform package is put in place, but the necessary steps are numerous and hard to co-ordinate, and entire reform programmes have seldom been enacted. For instance, governments often discontinue budgetary support but continue to guarantee borrowings from banks and pay and employment reforms have yielded little without increased managerial autonomy and accountability.

The third and more important problem of public enterprise reform is sustainability. Faced with a financial crisis or pushed by external forces, a government may initiate fundamental and far-reaching reforms in public enterprises that give managers the mandate and the power to run their enterprises in a commercial manner. As the reforms are put in place, economic and financial performance does improve, but as the crisis fades or the external pressure weakens, government ownership facilitates the revival of non-commercial objectives, which in turn often leads to renewed poor performance.

India's experience with public enterprise reform is no different. Indeed, India's biggest failure in its economic reforms programme is that there has not been a single transformation in public enterprises. There have been some marginal changes in wage conditions, managerial autonomy and so on, but these are very limited. Even if something

significant does happen, the chances are that it will not sustain.

It therefore appears that privatisation is the only way out. Yet privatisation has not made much of a headway in India. Why? The present paper attempts to answer this important question and in so doing it explores the political economy aspects of the privatisation process in India. To be specific, the paper explores the incentives that influence the behaviour of India's politicians and policy-makers while dealing with the privatisation issue in the country.

The paper is divided into five sections. Section II provides an idea of how properly designed and implemented privatisations may benefit India. Section III describes India's privatisation experience and paves the way for Section IV which explores the incentives that influence the behaviour of India's politicians and policy-makers while dealing with the privatisation issue in the country. Finally, Section V presents some concluding remarks.

### II Benefits from Privatisation

Privatisation, if designed and implemented properly, may benefit India in six ways. First, it will improve the environment public enterprises operate in and thereby strengthen their managers' incentives to be efficient, which in turn can contribute to making the Indian economy substantially more efficient, as can be seen from the available evidence on privatisations in India. The government of Andhra Pradesh's Allwyn Nissan (ANL), which incurred losses from the very beginning, in 1985, has done substantially better after its privatisation in 1988: the market share of the company, renamed as Mahindra Nissan Allwyn (MNAL) after privatisation, in the fiercely competitive light commercial vehicle market rose from 17 per cent before privatisation to 21 per cent at the end of 1990-91; the company made an entry into the export market and improved its status from being a loss-making company to a net profit-making one in 1990-91 [Reddy 1992]. The Board for Industrial and Financial Reconstruction has recently approved MNAL's merger with Mahindra and Mahindra (The Economic Times, Ahmedabad, August 4, 1994). The merger is expected to enable Mahindra and Mahindra make a substantially more efficient use of MNAL's plant and equipment and of its dealership and other infrastructure.

Bajaj (1994) has documented the privatisation of the government of Uttar Pradesh's Auto Tractors (ATL) which was established in Pratapgarh, a backward district of Uttar Pradesh, for manufacturing tractors and diesel engines. With ATL's losses accumulating to Rs 479.4 million at the end

of 1989-90 and there being no evidence of its being able to operate profitably, it was decided in November 1990 to close the plant down. The company was shortly thereafter converted into a joint venture with Sipani Automobiles (SAL), with SAL taking over the possession of the plant in March 1991. SAL has concentrated on the production of engines. It produced 1,249 engines in 1991-92 and 1,541 in 1992-93 (more recent information on this is not available), against 273 in 1988-89 and 267 in 1989-90, and has already started making a net profit.

Incidentally, Bajaj (1994) has reported that with ATL located in a backward district, posting as its chief executive was not considered an important position by senior civil servants. The result was that most of the time the civil servants posted to ATL were trying to get out. Politicians used the public enterprise as a source of patronage to enhance their influence by distributing jobs and favours. In this way they were seeking to maximise their influence rather than improve the performance of the enterprise. The interest of the enterprise was far removed from their mind.

No other privatisation in India has been documented. But some recent studies [e g, Megginson et al 1994] have compared public enterprises' performance before and after privatisation in a number of countries. These studies show considerable efficiency gains that have resulted from privatisation.

Second, privatisation may create conditions for substantial additional investment as also, especially if privatisation is accompanied by labour market reforms, conditions for the generation of a large number of productive employment opportunities, which in turn may contribute to removing poverty. According to a recent study [Kikeri et al 1994], privatisation revived a near-dead textile company in Niger, which now operates profitably at close to full capacity with a larger work force. The company exports much of its production and has won a large domestic market share against imports.

Third, consumers may also gain from privatisation. A recent study [Galal et al 1994], which examined the welfare consequences of selling selected public enterprises in Chile, Malaysia, Mexico and the UK, found that quite apart from any benefits from improved service, consumers for the most part gained or remained unaffected by privatisation. In the five cases in which consumers did lose. the (generally small) losses were attributable mostly to prices moving closer to their scarcity values. The study concluded, for example, that consumers in Chile were unaffected by the sale of ENERSIS, the sole electricity distributor in Santiago: paying consumers were better off, but this gain was balanced by losses to those who had hitherto

beengetting the electricity free through illegal connections. Which means that if only those who had previously been paying for electricity had been considered legitimate consumers, and that's the way it should have been, the study would have shown substantial increases in consumer welfare. These findings are especially relevant for the Indian situation, given the substantial losses that public entities in the power sector suffer because of illegal connections.

Fourth, given the environment that public enterprises in India currently operate in, they can spread their sickness even to efficient private enterprises in sectors in which both public and private enterprises coexist. Thus, a sick mill belonging to National Textile Corporation, a GOI enterprise, directed by the government to keep on running so as to keep its workers employed and to keep on selling its fabrics at a heavily subsidised price, can easily drive an efficient private sector mill producing comparable fabrics out of business. One can imagine what may happen to private investors currently planning to enter India's power sector if loss-making state electricity boards continue to operate. Privatisation can be of major help in addressing this problem and thereby in allowing the Indian economy to fully realise the potential benefits from industrial liberalisation that has been put in place.

Fifth, privatisation can be of help in reforming public intervention. India suffers from excessive public intervention, with public ownership and management of hundreds of enterprises being one form of public intervention. These enterprises are engaged in innumerable activities: manufacturing steel; building ships; generating and distributing electric power; running domestic and international airlines; exploring, producing and refining oil; operating domestic and international telecom network; running hotels; manufacturing polyester film; making condoms; producing fruit pulp and juice; running banks as also life and general insurance and electronic entertainment businesses; and so on. Privatisation will result in the correction of such distortions and allow the government to concentrate on things which it has failed to do but which it alone can do. As the recent outbreak of pneumonic plague in Surat and its rapid spread to other parts of India has highlighted, the government has failed to effectively intervene in the country's public health sector - and, as The Times of India has commented in a recent (January 2, 1995) lead editorial, "a dirty country cannot be globalised". And public health is not the only example of failure of public intervention in India. There are many such examples: protection of the environment, provision of primary education, maintenance of law and order, and so on.

Finally, privatisation can be of major help in reducing India's huge public sector deficit. This can happen in three ways. To begin with, the proceeds from the sale of public enterprises can be used to finance the public sector deficit or, in case the proceeds exceed the deficit, to reduce the outstanding public debt, both domestic and external. This in turn will reduce the burden of interest payments and thereby the deficit.

Another way in which privatisation can be of major help in reducing India's public sector deficit is by substantially reducing, if not totally eliminating, the public enterprises' various demands on the country's public sector finances. These demands, which add up to substantial amounts, include demands for budgetary support to loss making public enterprises, on the ground that this will enable the concerned public enterprises to restart and produce goods, Consider, for example, the additional budgetary support of Rs 1.1 billion that the GOI recently approved for the sick units of Fertiliser Corporation of India (FCI) and Hindustan Fertiliser Corporation (HFC), both GOI enterprises. The GOI's minister for chemicals and fertilisers is reported to have claimed that the additional budgetary support will enable FCI's and HFC's factories to restart and produce urea (The Times of India, November 20, 1994). That amounts to saying that every sick enterprise in the world can produce goods if subsidised. But that is no reason to provide budgetary support to a sick enterprise. The same money can be used much more productively elsewhere. The minister's gameplan was to throw good money after bad to keep workers happy. Privatisation will do away with all this nonsense and thereby help to reduce the deficit.

There is still another way in which privatisation can be of major help in reducing India's public sector deficit. With privatisation helping in putting the enormous assets, running into trillions of rupees, that public enterprises in India have built and acquired over the last nearly five decades, to substantially more productive uses, direct and indirect tax revenues from privatised firms can be expected to exceed by a wide margin the revenues on account of taxes and dividends currently received from public enterprises. The following two examples illustrate how this can happen. Malaysia sold a government sports lottery in 1985. By 1989 the revenues generated through levies on the privatised lottery were three times greater (in real terms) than the revenue from the former public enterprise [Galal et al 1994]. In Chile the net annual receipts from ENERSIS, the sole electricity distributor in Santiago, declined after privatisation because the government no longer received dividends on its equity, but tax revenue increased as

performance gradually improved [Galal et al 1994].

### III India's Privatisation Experience

India's privatisation experience can be discussed under six heads: selling a public enterprise's fractional equity, with the controlling ownership and management continuing to remain in the public sector: putting up of a public enterprise for sale. with the intention of transferring its control and management to the private sector, but the sale not going through; putting up a public enterprise for sale, the sale also going through, but scuttling the entire deal later; winding up a public enterprise; transferring the control and management of a public enterprise to the private sector, but with a substantial proportion of the equity, enough for managerial intervention, continuing to remain in the public sector; and complete privatisation, or what Bhagwati and Srinivasan (1993) call true privatisation, under which the control and management of a public enterprise is transferred to the private sector (though some public sector equity holding, without managerial intervention, may continue).

### SELLING FRACTIONAL EQUITY

Beginning July 1991, the GOI has put in place a programme to sell a part of its equity held in selected central public enterprises. The Economic Survey 1995-96 (Government of India 1996) provides year and public enterprisewise details of the equity sold during the period July 1, 1991to December 31, 1995. Three things emerge from these data. First, of the 246 non-departmental central public enterprises (CPEs), only 40 CPEs' equity was sold during this period. Second, the quantity of equity that was sold did not add up to much: in 19 of the CPEs in question, the equity sold added up to less than 10 percentage points; in seven, between 10 and 20 percentage points; in six, between 20 and 30 percentage points; in seven, between 30 and 40 percentage points; and in one, between 40 and 50 percentage points. Finally, the controlling ownership and management of all the 40 CPEs continued to remain with the GOI.

That's not all. Most of the equity that has been sold so far, has been sold only to public entities in the financial sector, with the Unit Trust of India alone, for example, accounting for 69.4 per cent of the total sales in 1991-92. This was done, as the minister of finance put it in response to a calling attention motion in the Rajya Sabha, "as it was the government's intention to ensure that the benefits accrued to public sector institutions rather than private entities in the

event of the sales taking place at an underpriced level" (*The Times of India*, Ahmedabad, August 7, 1993).

Public Enterprise Sale Not Going Through

A review of the available material suggests many cases of public enterprises which were put up for privatisation, but which could not be privatised. Examples are. Indian Iron and Steel Company, Scooters India and Great Eastern Hotel.

Indian Iron and Steel Company: The Indian Iron and Steel Company (IISCO), a subsidiary of Steel Authority of India (SAIL), a GOI enterprise, had accumulated losses of Rs 8.9 billion as on March 31, 1994 against its paid-up capital of Rs 3.9 billion; it thus had a negative net worth of Rs 5 billion at the end of 1993-94. According to a GOI diagnosis [Government of India 1991], IISCO's problems included: technological obsolescence; ageing plant and equipment; outmoded operational practices; and overmanning.

With the IISCO management not able to raise on its own the resources required for turning the company around, and with the GOI also not in a position to provide the required resources through budgetary support, the GOI decided to privatise the company and even found a buyer in Mukund. But as IISCO, which earlier used to be in the private sector, was acquired by the GOI under two acts of the parliament (viz, The Indian Iron and Steel Company (Taking Over of Management) Act of 1972 and The Indian Iron and Steel Company (Acquisition of Shares) Act of 1976), parliamentary approval is necessary for the privatisation to be put in place. Two bills to repeal these acts and thereby seek the parliament's approval for IISCO's privatisation were listed for introduction in the Lok Sabha on December 23, 1993 but, given the vehement protest of the Left Front and other other opposition members of the Lok Sabha, they had to be referred to a parliamentary committee. The GOI's minister of state for steel sought the support of the committee, called the Parliamentary Consultative Committee for privatisation of the Indian Iron and Steel Company, but his fervent • appeal did not receive any favorable response.

In March 1994 the IISCO's case was referred to the GOI's Board for Industrial and Financial Reconstruction (BIFR). The BIFR, set up in 1987 to implement the Sick Industrial Companies (Special Provisions) Act of 1985, appointed the Industrial Development Bank of India (IDBI) as the operating agency. The IDBI received a plan for the revival of IISCO. The plan, submitted by SAIL, was contingent on the GOI's ministry of steel providing a budgetary support of Rs 11 billion for reviving IISCO.

But the GOI has rejected the possibility of providing any budgetary support for turnarounding the ailing Burnpur (West Bengal)-based IISCO. Given India's political economy, this certainly is a bold decision—some people had argued that the then ruling Congress Party at the centre had no alternative but to provide the budgetary support in question, because in case it did not it would lose West Bengal in the 1996 general elections.

But what will happen to IISCO now? According to a recent report in *The Economic Times* (Ahmedabad edition, December 1, 1995), IISCO is now almost certain to be privatised, with Mukund, which earlier had offered to takeover IISCO, likely to bid again.

Scooters India: The Scooters India (SIL), a GOI enterprise, was incorporated as a public limited company in 1972 and started commercial production in 1975. It has two units located at Lucknow and New Delhi, with the Lucknow unit manufacturing two-wheelers and three-wheelers and the New Delhi unit, which is under lease, manufacturing electrical ceiling fans.

SIL has performed very poorly. Its accumulated losses amounted to Rs 4.8 billion on March 31, 1994 against its paid-up capital of Rs 78.1 million; it thus had a negative net worth of Rs 4.7 billion at the end of 1993-94, up from Rs 2.5 billion at the end of 1990-91 and Rs 0.7 billion at the end of 1985-86. According to a GOI study (1991), SIL continued to be in a had shape because (a) it had outdated plant and machinery, (b) it had excessive manpower, (c) it had poor marketing and servicing network, and (d) it was unable to compete in a highly competitive market.

The GOI decided, in 1987, to sell the Lucknow unit to Bajaj Auto, a major scooter producer in the private sector, but the decision could not be implemented because of the employees' opposition — SIL's 3,125 employees opposed the GOI's privatisation move because it was feared that it might result in a retrenchment of 1,625 employees [Business Standard, March 8, 1988, cited in Pendse 1991].

In May 1992 SIL was referred to the BIFR. A package for its rehabilitation and restructuring has recently been approved (The Economic Times, Ahmedabad, September 12, 1995). Complete details of the package are not available, but there is reason to believe that the package involves writing off of SIL's liabilities (interest and excise duty payable, and loan repayment) and voluntary retirement of workers. A joint management committee to oversee implementation of the package has also been set up.

Great Eastern Hotel: The Great Eastern Hotel, a government of West Bengal

(GOWB) enterprise, is an over 150-year old hotel, located in Calcutta. In 1994 the Communist Party of India (Marxist)-led GOWB decided to privatise the hotel and transfer the control and management to Accor Asia Pacific, a subsidiary of Accor SA of France, which planned to convert it into a 250-room five-star hotel at a cost of about Rs 950 million. Accor agreed to buy the hotel on the precondition that it would be allowed to retrench all of its 640 employees. The GOWB responded to this by offering the employees 36 to 40 months' salary, apart from provident fund and gratuity dues. But four labour unions, including those affiliated to the CITU and the INTUC, rejected the GOWB's offer.

Jyoti Basu, chief minister, GOWB had announced that the hotel would have to be closed if it was not privatised, given that the GOWB did not have the funds to subsidise it. But the CITU leaders are reported to have impressed upon the chief minister that the privatisation of Great Eastern Hotel just before the Lok Sabha and the West Bengal Assembly elections would not be politically wise. According to them, the Congress Party could use this as a weapon against the CPI(M), especially when the CPI(M) had opposed the privatisation of Bailadila mines (The Times of India, August 22, 1995). This suggests that the issue of privatising the Great Eastern Hotel may be revived, given that both the Lok Sabha and the West Bengal Assembly elections are now over and given that the CPI(M)-led Left Front has been returned to power in West Bengal, with Jyoti Basu as the chief minister.

Scuttling Sale of Public Enterprises

There has been at least one such case: the sale of the government of Uttar Pradesh's UP State Cement Corporation (UPSCCL). The UPSCCL had accumulated losses of Rs 1.6 billion as on March 31, 1990 against its net worth of Rs 0.7 billion; it thus had a negative net worth of Rs 0.9 billion at the end of 1989-90. The UPSCCL's problems included: inherent defects in plant design, inadequacy of trained technical personnel, poor maintenance, overmanning and recurring labour problems, low capacity utilisation, and high cost of production.

Considering the mounting losses, the government of Uttar Pradesh (GOUP) decided, in April 1990, to privatise UPSCCL. It found a buyer in Dalmia Industries. In February 1991 the GOUP and Dalmia Industries entered into a joint venture agreement which provided, among other things, for (a) the GOUP transferring 51 per cent of UPSCCL's equity to Dalmia Industries, with the balance of 49 per cent remaining with the GOUP, (b) the joint venture taking over all the employees of

UPSCCL, and (c) Dalmia Industries taking over the management of UPSCCL. The decision to transfer the equity and handover the management was opposed by the UPSCCL's employees. A petition was filed in the Allahabad High Court, which prohibited the GOUP from converting UPSCCL into a private corporation. The GOUP responded to this by transferring only 49 per cent of the equity, with the stipulation that another 2 per cent of the equity will be transferred after the court's decision. The GOUP also handed over the UPSCCL's management to Dalmia Industries. But as there was labour unrest, the transfer of management could take place only with the help of the police. The police also had to resort to firing to control the workers, as a result of which nine workers died.

After some time, a number of labour unions of the employees filed a petition, stating that as the interests of workers had already been safeguarded by the specific provisions in the agreement that no worker would be retrenched and that the service conditions would not be changed to their detriment, the petition earlier filed by them may be dismissed.

The events, however, took a dramatic turn. There was a change in government in Uttar Pradesh, with the new government deciding to cancel the agreement with Dalmia Industries and resuming the equity shares transferred to it through an ordinance issued on October 11, 1991. There has been a further deterioration in the UPSCCL's financial situation, with its accumulated losses on March 31, 1994 adding up to over four times its net worth. More recent information on its financial situation is not readily available.

### Winding up a Public Enterprise

As part of the country's economic reforms programme, the Sick Industrial Companies Act of 1985 was amended in December 1991 to bring public enterprises under the purview of the Board for Industrial and Financial Reconstruction (BIFR), Consequently, until the end of 1995, 138 cases of sick public enterprises were registered with the BIFR. The BIFR has recommended winding up in 14 of these cases.7 The public enterprises which the BIFR has recommended for winding up include: NTC (Gujarat), NTC (Madhya Pradesh), NTC (Uttar Pradesh), NTC (West Bengal), British India Corporation, Cawnpore Textiles, Elgin Mills, Mandya National Paper Mills, and National Bicycle Corporation.

But none of these public enterprises has been wound up so far. Indeed, the government seems to have abandoned, at least for the time being, even the idea of winding up public enterprises. The GOI's minister of industry is reported to have announced that whenever the BIFR ordered the winding up of a sick public enterprise, the GOI did not accept the order as 'final'. According to him, no stones would be left unturned to restructure, revive and strengthen public enterprises and the route of winding up would be adopted only as the last resort (The Times of India, Ahmedabad, October 21, 1995).

Transferring the Control and Management of Public Enterprise With Substantial Equity Remaining With Public Sector

There have been cases of public enterprises whose control and management has been transferred to the private sector, but a substantial proportion of their equity, enough for managerial intervention, has continued to remain in the public sector. The case of Maruti Udyog (MUL) is an excellent example of this kind of privatisation experience in India.

Until mid-1992 MUL used to be a public enterprise, with the GOI holding 60 per cent of its equity and Suzuki Motor Corporation (SMC) of Japan holding the remaining 40 per cent. Currently, SMC holds 50 per cent of MUL's equity, with the GOI holding 49.74 per cent and MUL employees the remaining 0.26 per cent. This allows the GOI to effectively intervene in decision-making at MUL. One can argue that this is not necessarily a bad thing, provided the intervention is in MUL's commercial interest. And this is where the rub is.

Consider, for example, the GOI's stand on the issue of MUL's proposed expansion and modernisation programme involving an investment of Rs 23.7 billion. MUL wants to modernise and expand in order to withstand the increased competition resulting from the opening up of India's passenger car sector while tightening the grip over its market share. The GOI wants MUL to finance the expansion and modernisation programme through borrowings and internal accruals, while SMC wants to use these routes as well as equity through an increase in the paidup capital. Responding to a question on SMC's objection to financing MUL's expansion and modernisation programme only through borrowings and internal accruals, SMC president Osamu Suzuki said: "There will have to be a balance between borrowing, equity and internal accruals. If anybody suggests that borrowings and internal accruals can be enough, he does not know business. Maybe some people in India are happy with the impasse. Maybe some car manufacturers are behind it as they resent Maruti's monopoly" (The Times of India. Ahmedabad, December 15, 1995).

And what is the GOI's objection to raising part of the required resources through equity?

The answer is simple, the GOI wants to retain its equity holding at the current level of 49.74 per cent, and in order to be able to do that it will have to shell out a substantial amount of money which it cannot afford to do. It cannot shell out the money largely because of its current difficult fiscal situation, but also because of the perverse signals that this will send out to all those who were denied budgetary support for the programmes that they had supported (e.g., programme for IISCO's revival) – they will argue that if the GOI can manage to find resources for investing in MUL's equity, it must find resources for, say, IISCO's revival as well.

The bottomline is that while MUL is no longer a public enterprise, the GOI's current actions are being guided much less by commercial rationality than by its desire not to dilute its current 49.74 per cent equity stake, so that it may continue to control MUL and effectively intervene in its affairs. The irony is that all this is being allowed to happen despite the noise that the GOI has made in recent years about getting out of non-core areas.

### Complete or True Privatisation

Finally, India's privatisation experience also includes cases of complete or true privatisation, under which the control and management of 'a public enterprise is transferred to the private sector (though some public sector equity holding, without managerial intervention, may continue). Indeed, a careful review of the available evidence, including the results of a recent The Economic Times survey on how 14 state governments have dealt with the privatisation issue (The Economic Times, Ahmedabad, February 17, 1996), clearly suggests many cases of complete or true privatisation in India. The public enterprises that have been completely or truly privatised in India include: ACC Babcock, Allwyn Nissan, Auto Tractors, East Coast Breweries and Distilleries, Goa Telecommunications, Goa Time Movers, Haryana Breweries, Hindustan Allwyn's refrigeration division, Orissa Mining Corporation's charge chrome plant, and Rajasthan State Tanneries Information on the total value of the public enterprises that have been completely or truly privatised so far is not available, but there is reason to believe that it does not add up to much.9

The foregoing discussion reveals the variety of ways in which India's politicians and policy-makers behave when it comes to dealing with the issue of privatisation in the country. But why do they behave the way they do? To be specific: Why doesn't the percentage of equity of the central public enterprises that the government of India has sold during the last roughly five years, add up to much? Why didn't the government of

India privatise the ailing Indian Iron and Steel Company, even though it had announced its decision to do so and had even found a buyer in Mukund? Why didn't the government of India privatise the ailing Scooters India, even though it had announced its decision to do so and had even found a buyer in Bajaj Auto? Why didn't the government of West Bengal privatise the ailing Great Eastern Hotel, even though it had announced its decision to do so and had even found a buyer in Accor Asia Pacific. a subsidiary of Accor SA of France? Why did the government of Uttar Pradesh scuttle the deal involving the privatisation of UP State Cement Corporation?10 Why haven't the public enterprises which have been recommended for winding up by the BIFR, have been wound up so far? Why is the government of India insisting that it must continue to control Maruti Udyog and effectively intervene in its affairs even though Maruti is no longer a public enterprise? Why did the government of Uttar Pradesh privatise Auto Tractors? Why did the government of Andhra Pradesh privatise Allwyn Nissan and Hyderabad Allwyn's refrigeration division? And so on.

I have developed a framework for addressing these issues. The framework explores the incentives that influence the behaviour of India's politicians and policymakers while dealing with the privatisation issue in the country. Section IV presents the framework.

### IV Incentives Influencing Behaviour of India's Politicians and Policy-Makers

While India's politicians and policymakers have generally opposed privatisation, they have also allowed the privatisation of certain public enterprises. A politician or policy-maker may oppose privatisation on ideological grounds - privatisation is a bad thing; public enterprises can be reformed. A politician or policy-maker may oppose privatisation also because s/he perceives privatisation as something which is not in his/her self-interest. A politician or policymaker may perceive the privatisation of a given public enterprise as damaging, directly or indirectly, the chances of his/her election/ re-election if that privatisation is likely to affect adversely one or more of the following interest groups: the public enterprise's employees, input suppliers, output dealers, and customers accustomed to subsidised output. Further, to the extent that a public enterprise can be used as a milch cow or as a source of patronage, or as both, its privatisation may be perceived by a politician or policy-maker as a development which is not in his/her self-interest.

On the other hand, when a politician or policy-maker allows the privatisation of a given public enterprise, he/she may do so, one may argue, because of one or more of the following considerations: ideological grounds (privatisation is good; it will benefit the economy in several ways), pressure from well-informed voters, and increasingly difficult public finance situation.

A careful review of the available evidence and discussions with knowledgeable people suggest that Indian politicians' and policymakers' opposition to privatisation has been influenced much less by ideological considerations than by considerations of self-interest. Indeed, the considerations of self-interest seem to have been so pervasive and overwhelming that it is these considerations which largely explain the issues raised earlier."

But this is not all. The increasingly difficult public finance situation has begun putting pressures on Indian politicians and policymakers to bahave differently. They have begun to realise that many sick public enterprises will have to be privatised for releasing scarce resources for more pressing public purposes and/or for some populist schemes that they had announced in their election manifestos. It is this recognition which, in my view, has triggered all the moves that have been made for complete or true privatisation in India. Also, it is this recognition which explains why the GOI is toying with the idea of selling Indian Iron and Steel Company to Mukund now.

But a given privatisation move does not necessarily turn into a complete or true privatisation. Much depends on how the process of transition from a privatisation move to a complete or true privatisation is managed. Given that most public enterprises in India are grossly overstaffed, a major consideration here relates to the employment implications of privatisation. In the Haryana Breweries privatisation case, the employment issue was handled by the buyer (Shaw Wallace and Company) and the seller (government of Haryana) entering into an agreement which clearly stipulated that "there will not be any retrenchment or downward revision of pay scale of existing workmen or employees" (Letter to Editor from R S Malik, commissioner and secretary, department of industry, government of Haryana, The Economic Times, July 26, 1994). Similarly, in the Allwyn Nissan (ANL) privatisation case, the employment issue was handled by the buyer (Mahindra and Mahindra) and the seller (government of Andhra Pradesh) entering into an agreement under which the buyer undertook to "protect the rights and service conditions of the employees on the payroll of ANL, abide by the written commitments of the present management to them and not envisage any reduction in the overall workforce" [Reddy 1992]. But in the GOI's Scooters India case, the privatisation move did not succeed as the employees opposed the move on the ground that it might result in retrenchment of roughly half the employees.

But all this does not necessarily suggest that in order for a privatisation move to succeed, the buyer must agree to employ all the workers. In the government of Uttar Pradesh's Auto Tractors (ATL) case. privatisation was not opposed even though the huyer (Sipani Automobiles) had made it clear that while preference would be given to the ATL employees, it would employ only as many workers as it considered necessary One may ask how such an outcome was managed. The answer lies in the fact that once it became evident that it would not be possible to operate ATL profitably, the government of Uttar Pradesh (GOUP) decided to close the plant, retrench all of its about 1,230 employees and pay them compensation and benefits, totalling about Rs 50 million, that they were entitled to, and it was only after all this had been done that the GOUP started exploring the options including that of privatisation, available to it, rather than exploring the privatisaior option while continuing to operate the plan [Bajaj 1994].

### V Where Do We Go from Here?

One may argue that although the progress on the privatisation front so far has not beer very encouraging, the momentum will pick up as time goes on, given the incentives fo privatisation that will result from a couple of pressures that are building up. First, the screw of budgetary support to finance public enterprise investments and losses is gradually being tightened - witness, for example, the developments on the IISCO front. Thi reflects India's public finance situation which continues to be bad. "There is", as Little (1996) has put it, "a time-bomb ticking away, since borrowing is at unsustainably high levels. India is heading for anothe crisis."

Second, the mechanisms which earlic served to protect public enterprises from the workings of competitive markets now stand eliminated to a large extent and as consequence public enterprises ar experiencing difficulties in responding to the new environment—witness, for example the exodus of qualified people from Bhara Electricals, National Thermal Powe Corporation, Indian Airlines, and so or This, combined with the gradual hardenin of the budget as also the reforms in the financial sector, may have the effect constantially weakening the public enterprise employees' opposition to privatisation

indeed, some of them may even start openly demanding privatisation.

While I do see a lot of merit in this argument, I believe that it will not be in India's interests to just wait for the above two pressures to work themselves out and thereby create the incentives for privatisation.

I believe that something more needs to be done - something that may make privatisation happen in India before India is driven to the wall. I believe that a major initiative for turning India toward privatisation needs to be launched. Its work programme will have four components, with the first component guided by the urgency of building and strengthening a constituency for privatisation in India. This will be considerably aided by the widest possible dissemination of information about the various benefits benefits not just on the public finance front, but on the efficiency and other fronts as well - that properly designed and implemented privatisations may bring to the Indian people. The people will have to be convinced that, given the extremely high opportunity costs, India cannot afford public sector misadventures in areas (e.g., running hotels, manufacturing polyester film, making condoms, and producing fruit pulp and juice) that properly belong to the private sector.

The second component of the work programme will address the issue of formulating a privatisation policy for India. This is important, for once the necessary climate conducive for privatisation has been created, it will be highly desirable to follow this up, as soon as possible, with the announcement of a properly structured and articulated privatisation policy. The policy will need to clearly address at least the following issues: why privatise?; what to privatise? (India cannot afford to limit its privatisation programme to certain sick public enterprises only; most of the other public enterprises (sick as well as non-sick) also will have to be privatised); when to privatise?; which organisation will serve as the nodal agency for privatisation and what will be its composition, powers and responsibilities?; what are the institutional mechanisms that will be put in place to gain public enterprise employees' support for privatisation?; and what is the role that India would like foreign investors to play in its privatisation programme?

The third component of the work programme will address the issue of capacity building for managing privatisations in India. Privatisation is a difficult process: it involves reconciling the government's political objectives and the business needs of a given public enterprise with the need to interest private investors in the enterprise and to generate efficiencies [Donaldson 1995]. It will therefore be absolutely necessary to come up with training programmes designed

to equip selected public enterprise managers and government officials in India with the knowledge and skills required for managing the various components of the privatisation process.

Finally, the proposed initiative will address the issue of evaluating India's post-privatisation experiences. This will involve rigorous work on estimating the impact of privatisation on efficiency and investment, on public finances and balance of payments, on employment, on management practices and strategies, and on managers' skills, attitudes and behaviour. Evaluations of post-privatisation experiences along these lines may generate ideas which may help India maximise the gains from privatisation.

### **Notes**

[This paper is a revised version of the paper prepared for the Center for Institutional Reform and the Informal Sector (IRIS), University of Maryland, College Park, Maryland, US. The author acknowledges with thanks the financial support he received from the IRIS and is grateful for the helpful comments received on the earlier version of the paper from participants at the Conference on 'Public Sector Restructuring and Labour Reform. Progress and Prospects' held in New Delhi on July 2, 1996. The views expressed in the paper are the sole responsibility of the author.]

- 1 Officials of Coal India (CIL), a GOI enterprise. are reported to have said that, under the national coal wage agreement, CIL is obliged to provide employment to the dependents of workers, irrespective of the vacancies, after the death of a worker while in service and after the termination of service of a worker on medical grounds after the age of 58. As a result of these provisions, CIL had to provide employment to over 62,000 people who are redundant (The Times of India, Ahmedabad, August 23, 1995) Available information suggests substantial overstaffing in many other public enterprises as well. A recent study [Banerii and Sahot 1994, cited in The World Bank 1995] reveals overstaffing of the order of 19-80 per cent in telecommunications, 91 per cent in Bombay Port (container section), and more than 33 per cent in steel, chemicals and textiles
- 2 Even this figure of 46 per cent understates the GOI's true interest hability as interest payments are calculated on a cash basis rather than on an accrual basis.
- 3 At least 100 senior personnel from Bharat Heavy Electricals (HEL), a GOI enterprise, are reported to have jumped the fence to join its MNC competitor, Asea Brown Boveri (The Times of India, Ahmedabad, January 13, 1995). Similarly, National Thermal Power Corporation, another GOI enterprise, is facing an exodus of its top brass (The Economic Times, Ahmedabad, December 1, 1995).
- 4 The Air India, a GOI enterprise, is reported to have sought the Ministry of Civil Aviation's "final clearance" for chartering an aircraft for a wedding in the air (The Times of India, Ahmedabad, October 6, 1994) – why couldn't

the Air India's management decide the matter on its own? Then, HMT, another GOI enterprise, is reported to have sought the government's permission to file suits against TUSRC of fran to recover expenditure incurred and damages for failing to honour the contractual obligations, it has also sought the government's approval to file a suit against a customer in Africa for overdue amounts against supplies (The Economic Times, Ahmedabad, October 16, 1995) – why could not the HMT management take decisions on the issues involved on its own and go ahead with their implementation, without seeking the government's permission/approval?

- 5 The proceeds from the sale of public enterprises should be treated as a financing (below-the-line) item, not as a receipt (above-the-line) item. A major advantage of such a treatment is that it eliminates all possible incentives to reduce a given public sector deficit with no or relatively small fiscal correction (Gupta 1993; also see Gupta and Levy 1993, and United Nations Development Programme 1993)
- 6 This subsection draws heavily on material in Bajaj (1994)
- 7 Of the remaining 124 cases of public enterprises registered with the BIFR, 26 were dismissed as non-maintainable, 29 were approved for revival, and 69 were pending for disposal
- s Press reports suggest that the GOI has won the battle, with the SMC agreeing to financing the MUL's proposed expansion and modernisation programme entirely by debt and internal accruals (The Economic Times, Ahmedabad, July 6, 1996)
- 9 The sale value of 76 per cent equity of ACC Babcock amounted to \$16.5 million (EPW Research Foundation 1995), that of 51 per cent equity of Haryana Breweries to Rs 75 million (The Economic Times, Ahmedabad July 16, 1994) and that of 74 per cent equity of Auto Tractors to Rs 55.5 million [Bajaj 1994]
- 10 The death of nine workers in the wake of transfer of the UP State Cement Corporation's (UPSCCL's) management to Dalmia Industries added a new dimension to the issue. The BJP took this up as one of the election issues and announced that it will scuttle the UPSCCL's privatisation if it came to power. The BJP won the elections and accordingly the agreement with Dalmia Industries was cancelled If the elections were held sometime later, things probably would have been different.
- 11 The following draws heavily on material in Gunta (1996)
  - The internal rate of return that the business of politics generates in India is pretty high. Politicians therefore want to get elected and re-elected. This explains the cut throat competition for votes that one witnesses votes for getting elected or re-elected, for example, as an MLA or an MP, and for getting elected or re-elected and then surviving as a chief minister or as prime ininister. And it is here that public enterprises, which elected politicians use as milch cattle, come in handy-access to the public enterprises' resources helps politicians in getting votes. This can happen in a variety of ways. First, public enterprises can be used to create and provide

jobs, often at wages/salaries higher than the market rates, to those who directly or indirectly help a politician in getting votes - in India it is much easier to create a job in a public enterprise than in a government department. This explains to a large extent the phenomenon of gross overstaffing and the resulting inefficiency in public enterprises. To illustrate: the cost of producing sugar in the government of Bihar's sugar mills recently ranged between Rs 9 and 245 per kg - six of the mills that were closed in 1992 were operating so inefficiently that their closure has enabled the government of Bihar, even with the employees continuing to be paid their wages/salaries, to reduce its budgetary support to finance their losses by Rs 70 million a year [Singh 1993]. Second, public enterprises can be used as parking places for selected members of a rival group within a political party, or for such other people whose support may be critical for the continued survival of, say, a chief minister. These people can be nominated or appointed as chairpersons or as members of the management boards of selected public enterprises. This is a standard practice in India, with the recent appointments to the boards of Gujarat's public enterprises being an example - the Gujarat chief minister is reported to have appointed supporters of one of his political rivals as chairpersons of Gujarat's public enterprises such as Gujarat Industrial Development Corporation and Gujarat State Export Corporation (The Economic Times, Ahmedabad, January 6, 1994). Finally, public enterprises can also be milched through leakages in, say, their spendings under various heads, both current and capital. Thus, plant and machinery required for implementing a public enterprise's investment projects, especially projects of a public enterprise operating in a regime of administered (cost-plus) pricing, may be acquired at inflated prices, with at least a part of the difference (between the market price and the actual price charged to the public enterprise) directly or indirectly accruing to an elected politician. And the resources so acquired can be used for facilitating the engineering of political defections, for financing the huge reelection expenses, and for many other purposes. Given the above state of affairs, no wonder most politicians and policy-makers oppose privatisation of public enterprises, especially now when, thanks to the economic reforms (e.g., substantial relaxations in the industrial licensing regime, removal of some of the price and distribution controls) that have been put in place, some of the opportunities for rent-seeking that they used to thrive on, have disappeared.

### Past and Future of Liberation Movements in World-System

### **Immanuel Wallerstein**

The achievement of power by the African National Congress in South Africa may mark the end of a world-systemic process that has been continuous since 1789, that of national liberation movements. Although antisystemic movements once in power failed to be liberatory, it is their very failure, and the resulting growth of independent anti-state movements, that provides hope for positive developments in the coming years.

THE African National Congress is one of the oldest national liberation movements in the world-system. It is also the latest movement to have achieved its primary objective, political power. It may well be the last of the national liberation movements to do so. And thus May 10, 1994 may mark not only the end of an era in South Africa but also the end of a world-systemic process that has been continuous since 1789.

'National liberation' as a term is of course recent, but the concept itself is much older. The concept in turn presumes two other concepts, 'nation' and 'liberation'. Neither of these concepts had much acceptance or legitimacy before the French revolution (although perhaps the political turmoil in British North America after 1765 that led to the American revolution reflected similar ideas). The French revolution transformed the geoculture of the modern world-system. It made widespread the belief that political change is 'normal' rather than exceptional, and that sovereignty of states (itself a concept that dates at most from the 16th century) resides not in a sovereign ruler (whether a monarch or a parliament) but in the 'people' as a whole.1

Since that time, these ideas have been taken seriously by many, many people - too many people as far as those in power are concerned. The principal political issue of the world-system for the past two centuries has been the struggle between those who wished to see these ideas implemented fully and those who resisted such a full implementation. This struggle has been a continuous one, hard-fought, and it has assumed multiple forms in the different regions of the world-system. Early on, there emerged class struggles in Great Britain, France, the US and elsewhere in the more industrialised zones of the world, which pitted an enlarged urban proletariat against both its bourgeois employers and the aristocracies still in power. There were also numerous nationalist movements which pitted the people of a "nation' against an 'outside' invader or against a dominant imperial centre, as in Spain and Egypt during the Napoleonic era, or as in the case of the multiple movements in Greece, Italy, Poland, Hungary,

and an ever-expanding list during the post-Napoleonic era. And there were still other situations in which the outside dominant force was combined with an internal settler population that made its own separate claims to autonomy, as in Ireland, Peru, and most significantly (though it is an often ignored case) Haiti. The movement in South Africa is basically a variant of this third category.

Even in the first half of the 19th century, as we can rapidly note, these movements were not limited to western Europe but included the peripheral zones of the worldsystem. And of course, as the years went by more and more movements were to be founded in what we later came to call the third world, or the south. In the period from circa 1870 to the first world war, a fourth variety emerged, that of movements in formally independent states in which the struggle against the 'ancien regime' was considered simultaneously to be a struggle for the renaissance of national vitality and therefore against the dominance of outside forces. Such were the movements that came into existence, for example, in Turkey, Persia, Afghanistan, China and Mexico.

What united all these movements was a sense that they knew who the 'people' were and what 'liberation' meant for the people. They also all shared the view that the people were not currently in power, were not truly free, and that there were concrete groups of persons who were responsible for this unjust, morally indefensible situation. Of course, the incredible variety of actual political situations meant that the detailed analyses made by the various movements were quite distinct, the ones from the others. And, as the internal situations changed over time, quite often the analyses of particular movements changed.

Nonetheless, despite the variety all these movements shared a second common feature as well, their middle-run strategy. Or at least it was shared by those movements which came to be important politically. The successful movements, the dominant movements, all believed in what we speak of as the two-state strategy: first attain political power, then transform the world. Their

common motto was expressed most pithily by Kwame Nkrumah: "Seek ye first the political kingdom, and all things shall be added unto you." This was the strategy followed by the socialist movements which centred their rhetoric around the workingclass, by the ethno-national movements which centred their rhetoric around those that shared a particular cultural heritage, as well as by those nationalist movements which used common residence and citizenship as the defining feature of their 'nation'.

It is this last variety to which we have given the name of national liberation movements. The quintessential movement of this kind, and the oldest of them, is the Indian National Congress, founded in 1885 and still existing (at least nominally) today. When the ANC was founded in 1912, it gave itself the name of the South African Native National Congress, adapting that of the Indian movement. Of course, the Indian National Congress had one feature that few other movements shared. It was led throughout the most difficult and important years of its history by Mahatma Gandhi, who had elaborated a worldview and a political tactic of non-violent resistance, 'satyagraha'. He elaborated this tactic first, in fact, in the context of the oppressive situation of South Africa, and later transferred it to India.

Whether the Indian struggle was won because of satyagraha, or despite satyagraha, is something we can long debate. What is clear is that the independence of India in 1947 became a prime symbolic event for the world-system. It symbolised both the triumph of a major liberation movement situated in the world's largest colony, and the implicit guarantee that the decolonisation of the rest of the world was politically inevitable. But it symbolised also that national liberation, when it came, arrived in a form less than, and other than, that which the movement had sought. India was partitioned. Terrible Hindu-Muslim massacres followed in the wake of independence. And Gandhi was assassinated by a so-called Hindu

The 25 years following the second world war were extraordinary on many counts. For

one thing, they represented the period of clear US hegemony in the world-system: unbeatable in terms of the efficiency of its productive enterprises, leader of a powerful political coalition that effectively contained world politics within a certain geopolitical order, imposing its version of the geoculture upon the rest of the world. This period was also remarkable for being the period of the largest single expansion of world production and accumulation of capital that the capitalist world-economy has known since its inception four centuries ago.

These two aspects of that era - US hegemony and the incredible expansion of the world-economy - are so salient in our minds that we often fail to notice that this was the era as well of the triumph of the historic antisystemic movements of the world-system. The movements of the Third International, the so-called Communist parties, came to control a third of the world's surface, that of the 'east'. In the 'west', the movements of the Second International were de facto in power everywhere, to some extent literally and usually for the first time, and indirectly the rest of the time insofar as the parties of the right fully acceded to the principles of the 'welfare state'. And in the 'south', one national liberation movement after another came to power - in Asia, in Africa, in Latin America. The only large zone in which this triumph was delayed was southern Africa, and this delay has now come to an end.

We do not discuss clearly enough the impact of this political triumph of the antisystemic movements. Looked at from the point of view of the middle of the 19th century, it was an absolutely extraordinary achievement. Compare the post-1945 period with that of the world-system in 1848. In 1848, we had in France the first attempt of a quasi-socialist movement to achieve power. The year 1848 is also called by historians the 'springtime of the nations'. But by 1851 all these quasi-insurrections had been easily suppressed everywhere. It seemed to the powerful people that the menace of the 'dangerous classes' had passed. In the process, the quarrels between the old landowning strata and the new more industrial bourgeois strata, which had so dominated the politics of the first half of the 19th century, were put aside in the successful, unified effort to contain the 'people' and the 'peoples'.

This restoration of order seemed to work. For some 15-20 years thereafter, no serious popular movements could be discerned anywhere inside or outside of Europe. Furthermore, the upper strata did not merely sit on their laurels as successful suppressors of liberation movements. They pursued a political programme not of reaction but of liberalism in order to ensure that the menace

of popular revolt would be buried forever. They commenced down the road of slow but steady reformism: extension of the suffrage, protection of the weak in the workplace, the beginnings of redistributive welfare, the building of an educational and health infrastructure that continuously extended its reach. They combined this programme of reform, still limited during the 19th century to the European world, with the propagation and legitimation of a pan-European racism - the white man's burden, the civilising mission, the 'yellow-peril', a new anti-Semitism - which served to incrustate the European lower strata within the folds of a right-wing, non-liberatory, national identity and identification.

I shall not review here the whole history of the modern world-system from 1870-1945, except to say that it was during this period that the major antisystemic movements were first created as national forces, with an international vocation. The struggle of there antisystemic movements, singly and collectively, against the liberal strategy of an iron hand within a velvet glove was an uphill struggle all the way. We may thus be amazed that, between 1945 and 1970, their struggle succeeded so swiftly and, when all is said and done, so easily. Indeed, we may be suspicious. Historical capitalism - as a mode of production, as a world-system, as a civilisation – has proved itself remarkably ingenious, flexible, and hardy. We should not underestimate its ability to contain opposition.

Let us therefore start by looking at this protracted struggle of the antisystemic movements in general, and the movements of national liberation in particular, from the perspective of the movements. The movements had to organise within a political environment that was hostile to them, one that was quite often ready to suppress or constrain considerably their political activity. The states engaged in such repression both directly on the movement as such as well as on its members (particularly the leaders and the cadres), and indirectly by the intimidation of potential members. They also denied moral legitimacy to the movements, and enlisted quite frequently the nonstate cultural structures (the churches, the world of knowledge, the media of communication) in the task of reinforcing this denial.

Against this massive barrage, each movement – which initially was almost always the work of small groups – sought to mobilise mass support and to canalise mass discontent and unrest. No doubt the movements were evoking themes and making analyses that resonated well with the mass of the population, but nonetheless effective political mobilisation was a long and arduous task. Most people live life day by day and

are reluctant to engage in the dangerous path of defying authority. Many persons are 'free riders', ready to applaud quietly the actions of the brave and the bold but waiting to see whether others among their peers are joining in active support of the movement.

What mobilises mass support? One cannot say it is the degree of oppression. For one thing, this is often a constant, and does not explain therefore why people who have been mobilised at T, were not already mobilised at T. Furthermore, quite often acute repression works, keeping the less audacious from being ready to participate actively in the movement. No, it is not oppression that mobilises masses, but hope and certainty the belief that the end of oppression is near, that a better world is truly possible. And nothing reinforces such hope and certainty than success. The long march of the antisystemic movements has been like a rolling stone. It gathered momentum over time. And the biggest argument that any given movement could use in order to mobilise support was the success of other movements. that seemed comparable and reasonably close in geography and culture.

From this perspective, the great internal debate of the movements – reform versus revolution – was a non-debate. Reformist tactics fed revolutionary tactics, and revolutionary tactics fed reformist tactics, provided only that they worked, in the very simple sense that the outcome of any particular effort was applauded as positive by mass sentiment (as distinguished from the sentiment of leaders and cadres). And this because any success mobilised mass support for further action, as long as the primary objective of state power had not yet been achieved.

The passions that surrounded the reform vs revolution debates were enormous. But they were passions that divided a small group of political tacticians. To be sure, these tacticians themselves believed that the differences in tactics mattered, both in the short run (efficacity) and in the middle run (outcome). It is not sure that history had proven them right in this belief, if one looks at what happened in the long run.

If one looks at this same process of mass mobilisation from the point of view of those in power, those against whom the movements were mobilising, one finds the obverse side of the coin. What those in power most feared was not the moral condemnation of the movements but their potential ability to disrupt the political arena by mass mobilisation. The initial reaction to the emergence of an antisystemic movement was always therefore to seek to maintain the leadership in isolation from its potential mass support – physical isolation, political isolation, social isolation. The states precisely denied the

legitimacy of movement leaders as 'spokespersons' for larger groups, alleging that they came in fact from different class and/or cultural backgrounds. This was the well known and well used theme of the 'outside agitators'.

There came however a point where, in a given locality, this theme of the movement as being merely intrusive 'agitators' no longer seemed to work. This turning point was the consequence both of the patient labours of the movement (quite often, once it had turned to a 'populist' mode) and of the contagious impact of the 'rolling stone' within the world-system. At this turning point, the defenders of the status quo were confronted with the identical dilemma of the movements, but in obverse form. As opposed to reform versus revolution, the defenders of the status quo debated concessions versus the hard line. This debate, which was constant, was also a non-debate. Hard-line tactics fed concessions, and concessions fed hard-line tactics, provided only that they worked, in the very simple sense that they altered the perspective of the movements on the one hand and of their mass support on the other.

The passions that surrounded hard line versus concession debates were enormous. But they were passions, once again, that divided a small group of political tacticians. These tacticians themselves believed that the differences in tactics mattered, both in the short run (efficacity) and in the middle run (outcome). But here too, it is not sure that history has prover them right in this belief, if one looks at what happened in the long run

In the long run, what happened is that the movements came to power just about everywhere, which marked a great symbolic change. Indeed, the moment of coming to power is everywhere well-marked in general perception. It was seen at the time and remembered later as a moment of catharsis, marking the accession at last of the 'people' to the exercise of sovereignty. It is also true, however, that the inovements came to power almost nowhere on their full terms, and the real change everywhere has been less than they had wanted and expected. This is the story of the movements in power.

The story of the movements in power is parallel in some ways to the story of the movements in mobilisation. The theory of the two-stage strategy had been that once a movement achieved power and controlled the state, it could then transform the world, at least its world. But this was of course not true. Indeed, it was in hindsight extraordinarily naive. It took the theory of sovereignty at its face value and assumed that sovereign states are autonomous. But of course they are not autonomous and they never have been. Even the most powerful

among them, like, for example, the contemporary US, are not truly sovereign. And when we come to very weak states, like for example Liberia, to speak of severeignty is a bad joke. All modern states, without exception, exist within the framework of the interstate system and are constrained by its rules and its politics. The productive activities within all modern states, without exception. occur within the framework of the capitalist world-economy and are constrained by its priorities and its economics. The cultural identities found within all modern states, without exception, exist within a geoculture and are constrained by its models and its intellectual hierarchies. Shouting that one is autonomous is a bit like Canute commanding the tides to recede.

What happened when movements came to power? They found first of all that they had to make concessions to those in power in the world-system as a whole. And not just any concessions, but important concessions. The argument that they all used themselves was that of Lenin in launching the NEP: the concessions are temporary; one step backwards and two steps forward. It was a powerful argument, since in those few cases where the movement did not make these concessions, it usually found itself ousted from power altogether soon thereafter. Still the concessions grated, leading to intraleadership quarrels and puzzlement and questioning by the mass of the population.

if the movement was to remain in power, there seemed to be only one possible policy at this point, the postponement of truly fundamental change, substituting for it the attempt to 'catch up' within the world-system. The regimes that the movements established all sought to make the state stronger within the world-economy and its standard of living nearer to that of the leading states. Since what the mass of the population usually really wanted was not 'fundamental change' (which was hard to envisage) but rather precisely to 'catch up' to the material benefits of the better-off (which was quite concrete), the switch in post-catharsis policies by the leaders of the movements was actually popular - provided it worked. There was the ruh!

The first thing we need to know in order to determine whether a policy works is the period of time over which we shall measure this. Between instantaneous time and the Greek calends there is a long continuum of possibilities. Naturally, the leadership of movements in power pleaded with its followers for a longer rather than a shorter time-span of measure. But what arguments could they give the mass of the population for permitting them such leeway? There were two main kinds of arguments. One was material: the demonstration that there were some immediate, meaningful, measurable

improvements, even if small ones, in the real situation. Some movements found it easier than others to achieve this, since the national situations varied. And it was easier to make such arguments at some moments in time than at others, given the fluctuating realities of the world-economy. There was only a limited degree to which it really was within the control of a movement in power to effectuate such meaningful, even if small, improvements.

There was, however, a second kind of argument, one about which movements in power found it easier to do something. It was the argument of hope and certainty. The movement could point to the rolling stone of the world's collectivity of liberation movements, and use this to demonstrate that history was (visibly) on their side. They thereby proffered the promise that if not they then their children would live better, and if not their children then their grandchildren. This is a very powerful argument, and it did indeed sustain movements in power for a long time, as we now can see. Faith moves mountains. And faith in the future maintains antisystemic movements in power - as long as faith endures.

Faith, as well all know, is subject to doubt. Doubt about the movements has been fed from two sources. One source has been the sins of the 'nomenklatura'. Movements in power means cadres in power. And cadres are human. They too wish for the good life, and are often less patient about achieving it than the mass of the population. Consequently, corruption, arrogance, and petty oppressiveness have been virtually inevitable, especially as the glow of the moment of catharsis recedes. The cadres of the new regime seemed over time to look increasingly like the cadres of the ancien regime, indeed often worse. This may have happened in five years; it may have taken 25 years; but it did happen repeatedly.

Still, what then, a revolution against the revolutionaries? Never right away. The same lethargy that made it a slow process to mobilise the mass of the population against the ancien regime operated here too. It is kes something more than the sins of the nomenklatura to undo movements in power. It takes a collapse in the immediate economy combined with a collapse in the certainty that the rolling stone is still rolling. When this happens, we have had the end of the 'post-revolutionary era', as has recently taken place in Russia and Algeria and many other countries.

Let us turn our look back to the worldwide rolling stone, the process within the world-system as a whole. I have already spoken of the long uphill struggle of the movements from 1870-1945, and the sudden breakthrough worldwide between 1945-1970. The sudden breakthrough led to considerable

triumphalism and was inebriating. It sustained the movements in the most difficult zones, like southern Africa. However, the biggest problem the movements have had to face was their success, not so much their individual successes but their collective worldwide success. When movements in power faced internal grumbling because of less than perfect performance, they could use the argument that their difficulties derived in large part from the hostility of powerful external forces, and in large part this was an absolutely true argument. But as more and more movements were in power in more and more countries, and as the movements themselves were using the argument of their growing collective strength, the attribution of their current difficulties to outside hostility seemed to lose its cogency. At the very least, it seemed to contradict the thesis that history was visibly on their side.

The failures of the movements in power was one of the basic underlying factors behind the worldwide revolution of 1968. All of a sudden, one heard voices everywhere wondering whether the limitations of the antisystemic movements in power derived less from the hostility of the forces of the status quo than from the collusion of these movements themselves with the forces of the status quo. The so-called old left found itself under attack everywhere. Wherever the national liberation movements were in power throughout the third world, they did not escape this criticism. Only those not yet in power remained largely unscathed.

If the revolutions of 1968 shook the popular base of the movements, the stagnation in the world-economy in the following two decades continued the dismantlement of the idols. In the period 1945-1970, the period of the great triumph of the movements, the great immediate promise was 'national development', which many of the movements called 'socialism'. Indeed, the movements said that they and they alone could speed up this process and realise it fully in their respective states. And between 1945-1970, this promise seemed to be plausible because the world-economy was expanding everywhere and a rising tide was lifting all ships.

But when the tide began to recede, the movements in power in peripheral zones of the world-economy found that they could do little to prevent the very negative impact of world economic stagnation on their states. They were less powerful than they thought, and than their populations thought – far less powerful. Disillusionment with the prospects of 'catching up' was translated in country after country into disillusionment with the movements themselves. They had sustained themselves in power by selling hope and certainty. They were now paying the price of dashed hopes and the end of certainty.

Into this moral crisis jumped the snakeoil salesmen, otherwise known as the 'Chicago boys', who, with the massive support of a reinvigorated hard line on the part of the people in power in the worldsystem as a whole, offered everyone the magic of the market as a substitute. But the 'market' can no more transform the economic prospects of the poorer 75 per cent of the world's population than taking vitamins can cure leukemia. It is a fake, and we will no doubt soon run the snake-oil salesmen out of town, but only once the damage is done.

In the middle of all this has occured the miracle of South Africa, providing a glow of bright light in this dismal world scene.It is time out of joint. It is the 1960s triumph of national liberation movements all over again, and it occurred in the place everyone had always said had the worst situation and the most intractable. The transformation happened very fast, and with astonishing smoothness. In a way, it is an extraordinarily unfair burden the world has placed on South Africa and on the ANC. They not only have to succeed for their own sake, but for the sake of all the rest of us. After South Africa comes no other, to serve as the still optimistic mobiliser of popular forces, to be cheered on by the solidarity movements of the world. It is as though the very concept of antisystemic movements in the world were given one last chance, as if we all found ourselves at the decisive moment in purgatory before history draws its final verdict.

I am not sure what will happen in South Africa in the next 10-15 years. How can anyone be? But I do feel that neither South Africans nor the rest of us should put the burden of the world on their shoulders. The burden of the world belongs on the world. It is enough for South Africans to bear their own burdens, and to take their fair share of the world's burdens. I shall therefore reserve my remaining words to the burden of the world.

Antisystemic movements as a structure, and as a concept, were the natural product of the post-1789 transformation of the geoculture of the world-system. Antisystemic movements were a product of the system; they of course had to be. However critical a balance-sheet we may now draw, and I fear that I have drawn such, I so not see any historic alternative that would have been better in the mid-19th century to going down the path they look. There existed no other force for human liberation. And if the antisystemic movements did not achieve human liberation, they at the very least reduced some human suffering and held the banner high for an alternative vision of the world. What reasonable person does not believe that South Africa is a better place today than it was 10 years ago? And whom should we credit other than the national liberation movement?

The basic problem lay in the strategy of the movements. They found themselves historically in a double bind. After 1848, there was only one objective that was politically feasible and offered some hope of immediate alleviation of the situation. This was the objective of taking power in the state structures, which provided the principal adjustment mechanism of the modern world-system. But taking power in the world-system was the one objective that ensured the eventual emasculation of the antisystemic movements and their incapacity to transform the world. They were in fact between Scylla and Charybdis: either immediate irrelevance or long-term failure. They chose the latter, hoping it was avoidable. Who would not?

I want to argue that today, paradoxically, the very failure of the antisystemic movements collectively, including the failure of the national liberation movements to be truly and fully liberatory, provides the most hopeful element for positive developments in the coming 25-50 years. To appreciate this curious view, we must come to terms with what is happening in the present. We are living not the final triumph of world capitalism but its first and only true crisis.<sup>2</sup>

I want to point out four long-term trends, each of which is moving near to its asymptote and each of which is devastating from the point of view of capitalists to pursue the endless accumulation of capital. The first, and the least discussed of these trends, is the deruralisation of the world. Only 200 years ago, 80-90 per cent of the world's population, and indeed of each country's population, was rural. Today worldwide, we are below 50 per cent and rapidly going down. Whole areas of the world have rural populations of less than 20 per cent, some less than 5 per cent. Well, so what, you may say? Are not urbanisation and modernity virtually synonymous? Is this not what we hoped would happen with the so-called industrial revolution? Yes, that is indeed the commonplace sociological generalisation we all have learned.

This is, however, to misunderstand how capitalism works. Surplus-value is always divided between those who have the capital and those who perform the labour. The terms of this division are in the final analysis political, the strength of the bargaining power of each side. Capitalists live with a basic contradiction. If worldwide the terms of renumeration of labour is too low, it limits the market and, as Adam Smith already told us, the extent of the division of labour is a function of the extent of the market. But if the terms are too high, it limits the profits. Workers, for their part, naturally always want to increase their share, and struggle politically to achieve this. Over time, wherever labour is concentrated, workers are able to make their syndical weight felt, and this leads eventually to one of the profit squeezes which have periodically occcurred throughout the history of the capitalist worldeconomy. Capitalists can only fight workers up to a point, because after this point too much reduction of real wages threatens to cut into effective world demand for their products. The recurrent solution has been to allow the better-paid workers to supply the market and to draw into the world work force new strata of persons who are politically weak and are willing for many reasons to accept very low wages, thereby reducing overall production costs. Over five centuries. they have consistently located such persons in rural zones and transformed them into urban proletarians who remain, however, low-cost workers only for a while, at which point others must be drawn into the labour supply. The deruralisation of the world threatens this essential process and thereby threatens the ability of capitalists to maintain the level of their global profits.

The second long-term trend is what is called the ecological crisis. From the point of view of capitalists, this should be called the threat of ending the externalisation of costs. Here again we have a critical process. A crucial element in the level of profits has always been that capitalists do not pay the totality of costs of their products. Some costs are 'externalised', that is, spread pro rata over the whole of larger populations, eventually over the whole of the world population. When a river is polluted by a chemical plant, the clean-up (if there is one) is normally assumed by taxpayers. What the ecologists have been noticing is the exhaustion of zones to pollute, of trees to be cut down, and so forth. The world faces the choice of ecological disaster or of forcing the internationalisation of costs. But forcing the internalisation of costs threatens seriously the ability to accumulate capital.

The third negative trend for capitalists is the democratisation of the world. We have mentioned previously the programme of concessions begun in the European zone in the 19th century which we have these days labelled generically the welfare state. These involve expenditures on a social wage: money for children and the aged, education, health facilities. This could work for a long time for two reasons: the recipients had modest demands at first, and only the Furopean workers were receiving this social wage. Today, workers everywhere expect it, and the level of their demands are significantly higher than they were even 50 years ago. Ultimately, these moneys can only come at the cost of accumulating capital. Democratisation is not and has never been in the interest of capitalists.

The fourth factor is the reversal of trends in state power. For 400 years, the states have

been increasing their power, both internally and externally, as the adjustment mechanisms of the world-system. This has been absolutely crucial for capital despite its anti-state rhetoric. States have guaranteed order but just as importantly they have guaranteed monopolies, which are the one and only path to serious accumulation of capital.

But the states can no longer perform their task as adjustment mechanisms. The democratisation of the world and the ecological crisis has placed an impossible level of demands on the state structures, who are all suffering a 'fiscal crisis'. But if they reduce expenditures in order to meet the fiscal crises, they also reduce their ability to adjust the system. It is a vicious circle, in which each failure of the state leads to less willingness to entrust it with tasks, and therefore to a generic tax revolt. But as the state becomes less solvent, it can perform existing tasks even less well. We have entered into this vortex already.

It is here that the failure of the movements enters in. It has been the movements, more than anyone else, which have in fact sustained the states politically, especially once they came to power. They served as the moral guarantor of the state structures. Insofar as the movements are losing their claims to support, because they can no longer offer hope and certainty the mass of the population is becoming profoundly anti-state. But states are needed most of all not by reformers and not by movements but by capitalists. The capitalist world-system cannot function well without strong states (of course some always stronger than others) within the framework of a strong interstate system. But capitalists have never been able to put forward this claim ideologically because their legitimacy derives from economic productivity and expansion of general welfare and not from either order or the guarantee of profits. In the last century, capitalists have relied increasingly on the movements to perform on their behalf the function of legitimating the state structures.

Today the movements are no longer able to do this. And, were they to try, they could not pull their populations along with them. Thus, we see springing forth everywhere non-state 'groups' which are assuming the role of protecting themselves and even of providing for their welfare. This is the path of global disorder down which we have been heading. It is the sign of disintegration of the modern world-system, of capitalism as a civilisation.

You can rest assured that those who have privilege will not sit back and watch this privilege go under without trying to rescue it. But you can rest equally assured that they cannot rescue it merely by adjusting the system once again, for all the reasons I have adduced. The world is in transition. Out of chaos will come a new order, different from the one we now know. Different, but not necessarily better.

That is where the movements come to once again. Those who have privilege will try to construct a new kind of historical system that will be unequal, hierarchical, and stable. They have the advantage of power, money, and the service of much intelligence. They will assuredly come up with something clever and workable. Can the movements, reinvigorated, match them? We are amidst a bifurcation of our system. The fluctuations are enormous, and little pushes will determine which way the process moves. The task of the liberation movements, no longer necessarily national liberation movements, is to take serious stock of the crisis of the system. the impasse of their past strategy, and the force of the genie of world popular discontent which has been unleashed precisely by the collapse of the old movements. It is a moment for utopistics, for intensive, rigorous analysis of historical alternatives. It is a moment when social scientists have something important to contribute, assuming they wish to do so. But it requires for social scientists as well an unthinking of their past concepts, derived from the same 19th-century situation that resulted in the strategies adopted by the antisystemic movements

Above all, it is a task neither for a day or a week nor on the other hand for centuries. It is a task precisely for the next 25-50 years, one whose outcome will be entirely the consequence of the kind of input we are ready and able to put into it.

### Panchayats in Western Uttar Pradesh

### 'Namesake' Members

### **G K Lieten**

Comprehensive rural development and panchayati raj have been associated with the rural economy and polity of Uttar Pradesh since the early 1950s. On the basis of a case study in a green revolution area in the north-western zone of the state, the composition and the internal functioning of the panchayats are examined. The author concludes that personalised control over resources is the key word.

PANCHAYATS for many decades in India have been considered as the key to rural development and as the crux of grassroots democracy. The modern idea was introduced by the British colonial administration and got indigenised when tagged on to Gandhian ideas of village development. Typical, however, for the controversy which has always surrounded the notion of 'local government' are the words spoken by the architect of the Constitution of India, B R Ambedkar, during the parliamentary debates, indicating why he was unwilling to insert a clause on village panchayats. While introducing the Draft Constitution on November 4, 1948, he remarked sarcastically that "the love of the intellectual Indians for the village community is of course infinite if not pathetic". He associated their ideas with the "fulsome praise bestowed upon it by Metcalfe" who, in his address to the House of Commons in 1832, had argued that the village communities as little republics lasted where nothing else lasted:

That they have survived through all the vicissitudes may be a fact. But mere survival has no value. The question is on what plane they have survived Surely on a low, on a selfish level. I hold that these village republics have been the ruination of India. I am therefore surprised that those who condemn provincialism and communalism should come forward as champions of the village. What is the village but a sink of localism, a den of ignorance, narrowmindedness and communalism? [Constituent Assembly, Volume VII: 39].

Although many studies in the past had warned against optimistic assumptions, confirming the warning voiced by Ambedkar, and various committees (e.g., the Balwantrai Mehta Committee in 1957 and the Ashok Mehta Committee in 1978) have suggested ways of amending the idea to correct for malfunctioning, inactivity, corruption, factionalism, etc, Rajiv Gandhi in the late 1980s reintroduced the idea of panchayat as the nodal point of rural development. Lurking behind his initiative was the suspicion that Congress losses in the

states motivated his government to "go direct to the village level to mobilise votes. Additionally, panchayati raj also began to be perceived as a handle to harass state government" [Maheshwari 1984:164]. Rajiv Gandhi held a number of well-publicised meetings with district collectors and panchayat leaders and then, in 1989, introduced the 64th Constitutional Amendment Bill. The bill, later enacted as the 1994 Constitutional Amendment Act, was received as the harbinger of a definite breakthrough in the local government enigma.

A closer study of one area in western Uttar Pradesh will indicate to what extent the positive expectations are likely to be fulfilled. The results may throw some light on the appropriateness of the devolution of power to panchayats as long as property relations, in particular the access to land, remain unaltered. In order to get an idea of the composition of the panchayats and the involvement of the members, a survey was undertaken among close to 100 members in the seven panchayat bodies in the nyaya panchayat around Sisauli in Shahpur block in Muzaffarnagar. The surveys were conducted in 1992 and 1995, after the April 1995 panchayat elections. In addition to an analysis of the quantitative composition in terms of a number of social variables (like age, education, gender, caste and class), some forays will be made into some discursive aspects. These forays may help us to judge the potential of panchayat members as social reformers and of the panchavat as a vehicle of rural development and enfranchisement.

### **New Members**

"The panchayat system is in full force in the district, and the parties to a jury of this kind usually take an oath on a 'lota' filled with salt to abide by any decision that may be arrived at". Procedures have changed since Atkinson (1879:76) described the caste panchayats as a tribunal dispensing justice and as the upkeepers of the moral order, particularly of the caste rules imposed by the brahmins [Blunt 1931:104-131]. The purpose has also been changed from a law-making and law-enforcing body<sup>2</sup> to a development agency, and its legitimisation has been based in the democratic election process, open to all.

Despite a whole range of mandatory and discretionary tasks and functions, the formal panchayat structure in Uttar Pradesh appears to have remained a languid body. It appears not to have grown beyond its perceived primary task: the dispersion of the financial resources coming in from the higher echelons. In order to be allowed to do this, panchayats have to be constituted democratically through an election process. The general conclusion is that they have been: candidates have been nominated (2, 5 million candidates for 0.8 million seats in the 1995 panchayat elections), elections have been organised (though very irregularly in the past), people generally have been allowed to vote, and swearing in signatories have been obtained so that the panchayats could start functioning as the lowest elected organs of the state.

The first issue to be taken up is the socioeconomic composition of the councils. General statistics on one block in Muzaffarnagar indicate that the panchayat membership is a fair reflection of the socioeconomic composition of the population. In terms of educational standards, as many as 40 per cent were illiterate in the pre-1995 councils, but also as many members had studied at least through class 10. In the new councils, less than one-third were illiterate, and only one-fourth of the members had studied at least up to class 10. Whereas the spread of primary education may have caused the former decline, the entry of women (exactly onethird of the members, as stipulated by the 1994 Constitutional Amendment Act), may have caused the latter decline.

An interesting development has taken place in the occupational background of the members. In the earlier panchayats, middle peasants made up around 40 per cent of the council; agricultural labourers and a dozen small peasants together accounted also for around 40 per cent of the total. In the new councils, agricultural labourers have become the biggest group (44 per cent), and together with small peasants (15 per cent) they numerically dominate the panchayats. Rich peasants, although only one-fifth of the membership, provided and continue to provide five of the seven pradhans. In the previous councils, there was only one professional, a teacher, who acted as an 'upapradhan', or 'chotapradhan' (small pradhan). In the new councils, there is none.

The differences between the old and the new councils are very much the result of an almost complete turnover in the membership; as many as 88 per cent of the members were newcomers. The old guard has been replaced by a new pradhan who has taken along with him a panel of members, all of whom were unopposed in the elections. One additional reason for the drastic turnover was the constitutional provision that one-third of the members henceforth should be women.

In the previous council, more than 10 per cent of the members were migrant workers. Their participation in the meetings was out of the question, and it may be assumed that they have not attended a single meeting. Their absent status did not disqualify them as panchayat members; on the contrary, the involvement of the resident members also was practically non-existent.

The situation in panchayat A, for example, was typical for the other panchayats as well, two members resided near Muzaffarnagar town as brick kiln workers, one member resided with his family in Shamli town, and one member was absconding after having committed a murder. The other nine members did reside in the village, but since two of them are women they had to be excluded from the participatory process as well.

Indeed, in none of the cases hae women ever been involved in anything related to panchayat work or public work in general. Some of the women even did not know that they were a member. Once or twice the pradhan had dispatched a document for signing, but they did not know what it was for. Without being derogatory towards women in general, the impression is that women stand a better chance of becoming

a member of the panchayat if they are illiterate, frail of body and of mind and rather old. The women who at least knew that they were panchayat members very rarely went to the meetings. If they did, then they only did so in order to put their thumb impression or to sign and the came back. The usual procedure, however, is for the pradhan to send the document to be signed to their house.

This procedure, as a matter of fact, applies not only to the women, but to most of the male members as well. In the panchayat which we have been describing (panchayat A), after the necessary deductions we were left with seven male members residing in the village. They were potential candidates for participation in the functioning of the panchayat. Four of them declared never to have attended and never to have been invited for a meeting. Two other members have attended whenever the pradhan wanted, i e, one or two times a year. Even the upopradhan cannot recall having attended more than one or two meetings. The pradhan himself on the other hand claims that meetings were held once a month, as per the guidelines, and that 'everybody turns up, the women

A similar situation prevailed in panchayat B: the pradhan asserted that he meets every month, the upopradhan and one orphaned member who works for the pradhan contend that they meet every second month, one female member is occasionally called to the pradhan's house to sign a document which she does not understand, two members reside outside the village, and seven members have never attended a meeting.

Are the other villages different? One village apparently is. In Panchayat C, procedures appear to be more in conformity with the legal specifications: not only did the pradhan assert that his council meets once a month, but also the upopradhan and two other members could recall that during one year or so, some five meetings had taken place. In addition, five members recall that they possibly had attended two meetings. Even in this panchayat, the meetings were spaced irregularly and take place only 'whenever the pradhan wants us'.

According to the pradhan of panchayat C, the decision-making process is very elaborate: voting takes place after all the arguments are heard. He appears not to be standing alone in his position: three members asserted that some discussion takes place on the proposals and then a vote of approval is taken. But most of the

members insist that they only go to the pradhan's house in order to sign the papers and then return home:

The meeting is a formality. Often the work we have to decide upon has already been executed. Whatever still has to be done has already been decided by the pradhan and we just put our signature.

In panchayat B, and in the other panchayats in the block, disagreements on proposals usually do not take place because of the simple reason that the pradhan calls only his own people. In two cases, even the upopradhan was not called for any meeting.

### NAMESAKE MEMBERS

Disagreement with the pradhan leads to ostracisation from the institution. Disenfranchisement indeed appears to be the logical reward for insistence on democratic rights.

It is definitely the case that members who have fought the elections on the panel of the defeated pradhan will not be invited by the victorious pradhan to the meetings of the panchayat, assuming that such meetings occasionally do take place. Some of these members bitterly complain that even their signatures must have been forged since they have never signed any document. They are probably correct, as the following story shows.

Bishambhar Singh is in his early 40s and claims some political commitment as a member of Mulayam Singh's Samaiwadi Party. He is a bachelor who looks after the land (two acres) and the tamily of his deceased brother. Since he was planning to get into politics and aspired to become the pradhan after the 1995 election, in 1988 he decided to stand for membership: "People voted for me but now I realise I am here for namesake only. The pradhan never asks for our views and when we tell him our suggestions and our complaints about some developments, he just does not listen to us. I take this as an insult. We are members for namesake only. People make a joke of us".

One of the pradhans was a relatively young man who in 1983, at the age of 35, became the pradhan as the heir to his father. He owns 25 acres of good agricultural land and a brick kiln and has important political connections. Despite his enormous wealth and his dynastical ascent, he talked as a man imbued with democratic principles. He preferred to solve problems in an amicable way, and he wanted the panchayat members at the monthly meetings to come forward with their own proposals and to put them

on the agenda of the meeting. However, he does not like them to vote on the proposals:

Voting will only create 'tanatani' (tension), and I prefer to shelve controversial proposals for the time being. In this way, I can maintain an amicable atmosphere. As a matter of fact, we are one big 'viradari'.

The excellent words did not fail to impress, but doubts about the veracity of the sermon started cropping up when he had some difficulty in telling the names of the panchayat members whom he was supposed to have met at least once every month over the preceding four years. Doubts spinned into incredulity when it then turned out that the pradhan had provided us with the names of members who actually were not members of the present panchayat, but of the old panchayat which had been superseded four years earlier.

Whether the newly constituted panchayats will be any different is unsure: towards the end of 1995, half a year after their constitution, not a single meeting had taken place after the inaugural meeting.

It is not surprising that many of the new members deplore their membership. Only for some of them the dissatisfaction is because they had expected to be in a position, as they claim, to do something for the development of the village. For most of the dissatisfied members, however, this factor did not carry any weight; they were asked to stand for the elections, and in obeisance to the prospective pradhan they agreed to the proposal. Some of them even claimed that their nomination has been filed by the pradhan without their consent. Santosh Singh, an illiterate labourer, was exactly 30 years old when the pradhan approached him for membership:

I am a member for namesake only ('nam ke liye') The pradhan wrote my name, filled my nomination form himself, and informed me that I am a member. I thought that he was cracking jokes, but when I put my thumb impression, I was convinced that I had become a member. But it is absolutely 'bekar' (useless). A member is 'bakwaas' (stupid fool).

'The pradhan forced it on me', is a complaint often uttered by members. They consider themselves as 'zabardasti (coerced) members. In a number of cases, the coercion is a pure physical threat Forever wary of potential conflicts, they have learned not to talk openly about village affairs to strangers, and quite a few members were reluctant to respond to our queries. In a few cases, they even insisted that the pradhan be present at the interview.

The justification was of two kinds. They either pleaded that as poor people they did not know anything ('garib anparh admi': the poor-and-illiterate-people argument) or that the pradhan was the 'malik' (master) of the village and that he was the only person who would be able to say what was supposed to be done and what had been done. Many devious ways of making them speak up failed.

The compliance with the wishes of the pradhan in a number of cases is related to economic reciprocity: as agricultural labourers on the land of the pradhan, or as recipients of IRDP loans or of houses built under government programmes, they are obliged. Mahindar Singh is a brick kiln worker of the bhangi or valmiki (sweeper) caste. Just before the pradhan proposed his name for membership, he was given a loan for house construction:

I myself was interested in membership, but it is really an insult. I have never been called for a meeting. I suppose that the pradhan wanted to buy me over. He filled my paper and informed me that I am a member, I think because I have some influence over my community people.

Others, on the other hand, have complied with the offer of membership because they probably genuinely expected to get involved in work for the betterment of the village. This is an orientation quite common among the younger members. Some of the women also appeared to be genuinely interested in taking up some initiatives. Their expectations have come to nought.

Indira is still in her late 20s and now wonders why the pradhan had asked her to become a member. She had to fight a battle with her relatives, but because of the support of her husband she could accept the offer: "At home I don't have much work and so I wanted to do some social work, but becoming a member was a great disappointment. Women should become self-sufficient and self-reliant but although I am so-called member, even I am kept absolutely bekar".

Another example is that of the illiterate Muzaffar, a poor trader and casual worker. He was fancied by the pradhan because "he thinks that I am his man". Behind the back of the pradhan, the discourse changes from gracious compliance to a litany of accusations. They are accusations of what has happened, among others the proverbial corruption to which we shall return later, and of what has not happened. Muzaffar has a whole list of works which should be taken up by the panchayat but since "the pradhan is corrupt and careless about the

poor people", not much has been done. He lists four of them as the most important: village roads, (better) educational facilities, drinking water supply and health facilities.

PUBLIC WORKS AND PRIVATE CORRUPTION

Village roads, education, drinking water and health are the priorities high on the agenda of most of the members who apparently had given a thought to what could be done. Illustrative of this non-involvement, however, is the fact that more than one-fourth of the members, excluding the absent members, could not come forward with suggestions for any improvement which they considered necessary. The reason why around one quarter of the panchayat members could not offer any suggestions should probably be imputed to fear psychosis rather than to a dull mental process.<sup>3</sup>

The works which are listed by the members as requiring priority attention involve those basic and rudimentary provisions which one had expected to already have been put in place after many decades of rural development planning in one of the richest regions of India. It is not that the facilities are altogether absent. Primary schools (up to class V) have been constructed, but the maintenance leaves much to be desired and the teachers often do not turn up. Most villages have only a primary school, which makes it imperative for the young children to go to a supra-local junior high school for the next forms. Especially for girls, this is experienced as a step too high to take. Government primary health centres are absent or have not been functioning since their inception. In panchayat D, for example, neither doctor nor nurses have ever turned up, and the building by now has become decrepit. The inter-village roads are quite good but the intra-village lanes are in a decrepit state. Public water pumps have been installed, but only two or three per village. Some houses for harijans have been constructed and some IRDP loans for the purchase of carts ('buggy') have been provided.

As to the reasons why the public works have not been undertaken, the pradhans and the members differ fundamentally. The pradhans are quite exquisite while enumerating all the good deeds they have done with the available resources: according to them, roads have been constructed and repaired, loans have been distributed to the poor people, houses have been built for them, handpumps have been installed, etc. One of them, generally regarded as the most corrupt pradhan in the neighbourhood, blames

. . . . . .

insufficiency of funds and wrong allocation by the government as the reason for the slack performance:

We want to work even harder for the improvement of the village, but the funds are insufficient. And also, the government has earmarked the money for certain purposes. So we are constrained by this wrong allocation The pradhan should have more power to use the money where it is needed. And then there are the 'dalal' (middlemen) and 'goondas'. They are protected by the block officials and by the politicians. All this prevents the money from being used for village development.

The pradhans indeed are unanimous that they should have more discretionary powers in allocating the money which has been earmarked for village development. They prefer to go back to the days when decisions could be taken at the village level without the involvement of the block level and higher officials. It is alleged that they take their cuts before handing over the money. One pradhan knows for sure that people who want to get a loan will give money to the block officials, and that since the pradhan himself is excluded from the transactions and from the decision-making process, "unfortunately, harijans and poor peasants never get the loans". The members most sympathetic to the pradhan also put the blame on the shoulders of the block officers. These officers are said to pocket all the money and the pradhan is only considered as a 'kamzor', a weakling.

The field reality is somewhat different though: financial matters are the joint domain of the pradhan and the higher officials. Shekar, a brahmin who had been a member of the panchayat since the mid-1970s until 1995, agrees with the quotation (he himself got a loan for a cart) but disagrees with the shifting of the responsibility:

The pradhan himself is very shrewd He does everything on his own, and the block officials will deal with him only and with nobody else in the village. The pradhan and chotapradhan and the block officers can tell you who is getting the loans and how much money is being spent on the works. We do not know anything.

All the members, whether they are brahmin, jat or harijan, literate or illiterate, all have one common handicap: except for the pradhan, and in most cases the upopradhan as well, nobody knows how much money is available to the panchayat. The key to the safe is with the pradhan, the block officials and the bank managers. Most of the members put all the blame for the non-execution of works on the pradhan. Apart from considering him as lazy and as

an incompetent 'befkuf' (stupid fellow), practically all the members rebuke his secretive manner such that they are left in the dark about all the money which is supposed to come into the village. The following statements are typically used by the members to describe the pradhan:

The pradhan is a corrupt man par excellence. He has eaten up all the money. He is a 'chor' (thief) and a 'sharabi' (drunkard). He is lazy and stupid. He should be kept behind bars He should be punished. He is friendly with the goondas and only helps his chamchas (sycophants). He has destroyed the village.

The pradhans, with the exception of the pradhan in panchayat C, are accused of not only pocketing the money provided by government programmes, but of collecting money from the villagers for 'shramdan' programmes which did not materialise. Of course, they say, they have also taken up some works, but each time they have seen to it that they were paid properly, either as a bribe or just by using false signatures.

Panchayati raj could be made to function as a good system for the village in the sense that it already has contributed a small measure to the development works in the village, and in the sense that it could dispense justice and maintain peace. But because of the way it is organised now, the members feel, it all falls flat on account of the pradhan.

### 'FATAFAT' ELECTIONS

The solution proposed by some members who apparently have pinned their hopes on more power and resources coming their way, is that the pradhan should be more efficient and should be more of a 'zimmedar' (a trustworthy person). The members should get more power to intervene and to be involved. There should be honesty and efficiency. If only the sitting pradhan could be replaced by a good and efficient person, and if they themselves could do the job, "it would have changed the face of the village", as one of them contended. Such expectations of an improvement in the system are maintained by a number of members. meetings should be convened, works should not be undertaken without consulting the members, the money subsidies for the poor should go to the poor.

They are pious hopes which will lead to a false dawn, it seems, for the economic base supporting the political structure remains unaltered. Nay, argue many, panchayati raj cannot bring any solace. As long as the money is coming to the village, the pradhan and his intermediaries will get corrupted and it will help in spreading dishonesty. A

few members therefore plead for more power to the administration (the block officials), but many more want to go much further and see in president's rule or in military rule the only solution. Military order "as during the British days", in the context of absolute disorder and terror politics, has become an attractive proposition.<sup>4</sup>

After the dramatic events around 1990, faith in the survival and the usefulness of the democratic structure apparently has returned, but for many low-caste people the freedom of choice remains impaired by the jat musclemen. From among them we heard many stories confirming the general suspicion, elections are done the fatafat way, i.e., quickly by a number of men who stuff the boxes with ballot papers in support of their candidate. Depending on what the dominant jat section had decided, votes would be cast in favour of that candidate. This voting procedure is quite simply referred to as fatafat.

Sona is a middle-aged valmiki member. She has never attended a meeting of her panchayat and has hardly ever voted for parliamentary, legislative or panchayat elections. She was one of the many members who, when asked for their voting preference answered, "if allowed to vote" and continued:

Although I am illiterate, I know that voting is important because by voting we choose our leader, but these days the vote does not have a value. It is all 'goondagarhi'. During election time, the goondagarhi of the jats is most rampant. Elections are a question of fatafat. It went fatafat. They did not even allow us to come close to the polling station.

Politics is more and more being conceived of in terms of goondagarhi and 'bhrashtachar' (criminalisation and corruption). The assertion that "the police, the politicians, the big people, they all have their goondas", is a common one. It belongs to the village discourse and does suggest an adverse predisposition towards politics. This is not necessarily the case. It is rather an expression of disempowerment by the dominant faction.

### Social Void

Canchayat membership comes with age: more than four-fifths of all the members are in their 40s and 50s. The pradhans actually used to be in their 50s and 60s, had a long career of village politics behind them, and had been functioning as pradhan for at least two terms. The only first term pradhan before the 1995 elections was the relatively young P P Singh who has taken over the reigns from the deceased pradhan in his village. His young age was balanced by his superior wealth: his family cultivates 25

acres of land. In the new panchayats, the average age has come down slightly, but for younger people they obviously do not serve as a vehicle for starting a political career. Nor are they an arena in which young people can get involved and start social activities. Most of the members in the old council (around 85 per cent) and practically all the members in the new councils actually do not have any social involvement outside the panchayat membership.

Membership of social organisations is limited. The explanation could very well be that except for the BKU, there is not much organisational activity in which one can get involved.6 Active involvement on issues or in movements around social issues is even more limited. It is actually non-existent. Most of the members have never been called upon to intervene even in small social matters. Only seven members were prepared to state that they were involved in social issues, which in each case meant that they commanded so much authority or respect that they would be called upon to solve smaller conflicts within their community. The panchayat members in this area, and therefore also the agenda of the panchayats, are devoid of social concerns; they operate in a social void.

If panchayat bodies are to play a role not only in economic development but also in changing the mores and values of the people, panchayat members themselves should be expected to set an innovating trend, for example, in respect to the undermining of the caste system and the emancipation of women.

Until 1995, there usually was only one female panchayat member. The nominated members themselves usually pretended not to know much about the panchayat system, but when it comes to their own position they usually are clear about their priorities. Sona, the middle-aged, poor peasant valmiki, has been nominated by the pradhan to become a member. Although she has ideas about latrines, maternity centre, etc, she had never been asked to do anything or to attend a meeting. It is her 'kismat' (destiny), but she also considers herself lucky with a good husband:

I know many women who are suffering at the hands of their husbands. There should be more independence for them. Some financial freedom is required so that one can go and buy things in Sisauli without having to go and ask the husband. Education is important, but it also depends on how the husbands change and how society changes.

Indira is 15 years younger and has received some education in the village school, but

otherwise her situation is comparable to that of Sona. Hers also is a poor peasant family with a modern line-up – husband, wife and two children:

I want equality among men and among women, and between men and women also. Women should become self-sufficient and self-reliant, and they should get educated; only then things can change. Jobs are necessary for women. I want to go and work, in the hospital, stitching work, or so, but the men in the in-law's house do not allow it. I wish I could do something through the panchayat, but that also is not allowed.

Some of the better educated males of well-situated families have adjusted. Ravikant Pal insists that he treats the women in his joint family as human beings. His daughters have studied up to class 12 and one of them contracted a love marriage. A few other jats and harijans agree that the male should not continue to be the absolute 'malik', but argue that it is difficult to bring women into public life. This really starts already when the girls have finished class five and have to go to the high school in adjoining villages. This is considered difficult, for eve-teasing is going on, the atmosphere generally is not conducive to it, etc.

Social conditions are used as an apology for inaction. Most male members, however, do not see this as a problem: girls should go to school, but only to learn to read and write, and there is no need for them to go for higher education, for in that case they might 'go and sit on the head' of the males. Their freedom should be limited, and they should not indulge too much in public activities. They are regarded as not knowing anything, and of not being of much use in the panchayats: 'She should take proper care of the house only' is an often heard proposition.

The composition of the panchayats fairly reflects the village population. Around half of the members are jats and one-fifth are harijans. In the old councils, brahmins and kshatriyas accounted for only 9 per cent of the seats, slightly less than the backward castes. In the new councils, the OBC membership has increased to one-fifth and brahmins have all but disappeared from the councils.

Quite a number of jat members argue that the caste system is bad, that only humanity counts, and that therefore the politicians should stop this game of setting up one caste against another. An unambiguous defence of the caste system by the jats is hard to come by. With a handful of exceptions, however, they continue to locate themselves in caste terms, even if restricted to marriage only. In their discourse, jat members are on the defensive in the sense that rather than

defending the caste system, they argue that like any social arrangement, it has got some advantages, and that anyway, it cannot be abolished in one stroke.

In the meantime, not only bhangis and chamars but brahmins as well complain that village life, and the panchayat structure, are clearly dominated by jat families who sign for the seven pradhans.

The dominance and muscle power of the jats is so imposing that at election time, the lower caste members are not even allowed to vote, SCs and OBCs, unlike the brahmins. feel the caste oppression in daily life also. Earlier, the jats would not come near the houses of the harijans, and the harijans would not be allowed to sit on their charpoy or take food except that served straight into the hand.8 The SC members, who feel that they are still considered as 'acchut' (untouchable). also agree that social behaviour is not as bad as what it used to be. Many of the restrictions have waned. But as long as the money and the jobs are with the upper castes, respect for the lower castes will remain minimal.

That is one reason for some of them to have welcomed V P Singh, and why they have committed themselves to the SP. They hope that some change will be brought in from the outside; they themselves are unwilling to start any social movement which may break the rules set by the jats. All the Muslim members, practically all the SC members, and less than half the OBC members were supporters of the Samajwadi Party. The BSP did not have much appeal.

Only around 5 per cent of the members in 1995 had remained with either the INC or Janata Party, which in the old council could still count on the support of more than one-third of the members. Most of the jats had transferred their support from the Janata and Congress to the BJP, which was the favourite party of more than half of all the members and which had the allegance of the seven pradhans in the block.

### CONCLUDING REMARKS

The survey of close to 100 members of seven panchayats around Sisauli has uncovered an interesting and rather simplistic typology. By and large, panchayats exist in name only and most members appreciate their own membership as such: it is a formality only. A pattern of dominance by the pradhan has been allowed to grow to the extent that he is the only hinge on which depends the deployment of state resources and initiatives. The system is allowed to continue as long as it keeps joint business with officials from the higher echelons. Such

an important personalised position in none of the cases has been shown to lead to more than mere token interventions for the common good. It is the pradhan who decides the type and the modalities of the works to be undertaken with, in the best of cases, a passive involvement of some of the members.

The inactivity of the panchayat members is a reflection of the general absence of social involvement. Since politics and activism are the domain of the dominant personalities in the jat 'thok', no autonomously initiated movements can take place. Although on many social issues – the continuation of the caste system and the position of women for example – the ground is shifting, and a further shift is blocked by the position of the dominant thok leaders. They maintain the traditional social order to the extent that it further maintains caste/class and gender suppression.

The pious hopes of some members, including female members, of furthering human, social and economic development through the panchayats have proven to be out of touch with reality. The dismal performance of panchayats in another state (Madhya Pradesh) notwithstanding, has led Mathew and Nayak (1996:1771) to the conclusion that they provide a "democratic forum to grapple with social and political issues in the open" and that "the churning process will continue". For the time being, it is more an expression of hope and expectation. Its fruition may be conditioned by "people aligning on party lines". In our case study, in the absence of party politics the pradhan has continued to operate the panchayats as his private domain.

The closer study of one area in western Uttar Pradesh has indicated that the positive expectations surrounding the 1994 constitutional amendment are by and large unwarranted. The panchayats remain inappropriate instruments for rural development and for denting the landed power formations. The predictions made by Ambedkar half a century ago remain valid.

### Notes

1 They existed mainly among the 'advaitinal castes. Even among the jats, permanent panchayats existed only in a few areas as thok (lineage) panchayat [Pradhan 1966]. The offences triable by the caste panchayat varied, but usually included the following: (inter)caste adultery, breaches of commensal rules, drunkenness, breaches of caste trade rules, insulting brahmins, cow-killing, etc. The sentences included pilgrimages, compulsory begging, public humiliation, and, as a rule, fines to be used to feed the brotherhood and an extra fine to feed the brahmins [Blunt 1931:115-17]

- 2 This function of the caste panchayats has not altogether vanished from the area. It is occasionally still made use of when the village patriarchs wish to impose their rule and lifestyles on deviant family members, caste members or villagers. A recent and gruesome example in the district relates to the beheading by the panchayat of a young harijan couple who had eloped to Delhi and Haryana, and who after having been enticed back to their village with sweet promises, were conferred the ultimate verdict, executed with an axe by one of the fathers (The Times of India, August 10, 1993; Economic Times, August 14, 1993).
- 3 A non-response is often wrongly translated by the interviewer as a lack of knowledge and perception. Respondents often indeed prefer to talk up to the interviewer, agreeing with the assumed world view of the interviewer, the superior outsider, or to keep silent and refer the interviewer to the people who should know, i.e., the malik (the husband, the employer or the dominant village elite). Many of the interviewees actually, after having stated that they did not know what was needed in the village, told us to go and see the pradhan and to find out. If we insisted we could interview them, but only in the presence of the pradhan.
- 4 In particular, the traumatic events of the early 1990s have bewildered many villagers Political violence had never been absent from the area, but the flaring of religious and social tension in the wake of the assassination of Indira Gandhi and Rajiv Gandhi, and in the wake of the Mandal Commission and of the Ayodhya skirmishes, had instilled fear in many villagers
- The fortunes of the pradhan usually last longer than the party's fortunes. For example, Sukhbean Singh was already the pradhan of his village from 1960 till 1973. At that time, he was still with the CPI. He suffered from the general decline of the party, and his change-over to Congress did not help him until 1988 when he was re-elected.

- 6 Surprisingly, only 12 members, usually the bigger landowners, were stated to be involved with the BKU, most of them rather passively. Only six members were associated with educational institutions in the area. Two of the members were also members of a religious organisation (the Arya Samaj), and two members are somewhat actively involved in party politics
- 7 Ironically, only some of the OBC kahars are prepared to publicly stand by the caste system: "If we are all allowed to become equal, there will not be a difference between us and a cobbler or a sweeper. It will be the worst for all of us". Therefore, the caste system should continue to exist in order to demarcate the people, but "it should not be used by politicians to divide the people".
- 8 In the mid-1950s it was reported to Kolenda (1983:136) about the rajputs in the same area: "The rajputs are ever ready to have contact with our women, but with us men, they dont' even let us touch their clothes".

### More on Land Rights for Women

### Indu Agnihotri

IN her long rejoinder to my review (EPW, March 8) of her book, Bina Agarwal has chosen to adopt an extremely vituperative tone bordering on a vicious personal attack (EPW, June 8). Notwithstanding her citation of long extracts from her book, the central questions raised in the review remain unanswered. To set the record straight, I shall reiterate some of these.

Agarwal admits that only 1.04 million hectares of land is available for distribution and that this would constitute approximately 0.56 per cent of the country's arable land. The question that I had raised was that if land reform, per se, has ceased to be on the agenda for most political parties, except those on the left, then where would the land that women should be in control of be made available from? In the absence of an emphasis on land reform the demand for land rights for women can easily end up being reduced to a demand for land for women from the already propertied classes. This would not be representative of the range of positions taken up in the women's movement; nor would it shift the focus to the dalit and landless sections of rural women, something that is urgently needed and being felt within the movement. This aspect gains renewed importance in the wake of prevailing landlessness and pauperisation (as obvious from figures cited in Agarwal's book and from the more recent changes in economic

The question arose partly because in Agarwal's book the discussion on land reforms is unfortunately largely on a negative note except in the early part where the farm size productivity debate is cited to counter the argument that recognition of women's title to land would lead to further fragmentation and an increase in the number of economically non-viable holdings.

The discussion on group 'pallas' which Agarwal wants to focus on would have to be preceded by a renewed commitment to land reforms which in a sense is totally missing at the present political juncture when reforms are aimed at handing over land to multi-nationals for agro-industries.

In the discussion on Operation Barga, contrary to the alleged 'oversensitivity' on my part, I had been very forthright. The question I had raised was that the patriarchal bias in West Bengal's land distribution

programme needs to be probed and that there was a background of debate on this issue among activists on the left. The point made was that it is not enough to accuse the Left Front of not giving land to women. The patriarchal bias with regard to land rights is not a leftist prerogative. It goes back deep into history and as Agarwal herself shows is shared by other peasant-based communities/economies in south Asia. It was in this context that the question about the need to focus on aspects of production and women's role in the production process was raised. Why is the act of ploughing made out to be the function most central for the definition of a 'tiller', I had queried. That this is a key issue would be borne out by historians, anthropologists and policymakers alike. Why should all other functions and agriculture-related work in which women, by all accounts play a major and even crucial role, be underplayed? This was one of the reasons given by me in asking Agarwal for more discussion on production. Added to this was the expectation that Agarwal, being a trained economist, could cull out evidence and focus on women's role in production to a far greater extent than others.

The actions of the colonial state which seemingly only recorded the rights in land as they existed in fact constituted an active intervention in denying rights to entire communities and peoples, including women, and creating new rights where none existed earlier. In their passionate search for loyalists, leaders of the community, yeoman, and the much flaunted superior agriculturists, the British created new stereotypes. The damage caused to women's position in the wake of dysfunction of the economy under colonial rule was neither unintended nor negligible. The reference to archival records was made in this context, to argue that digging into the unpublished proceedings of the British government may help throw more light on the making of the Indian peasant as a 'male'. Also, perusal of unpublished and nonofficial records, even with reference to the Garos would lay bare the nature and impact of British policy interventions in a region where women's participation in agriculture remains central to the economy of the region. The interlinkages between changes in production patterns, women's status and

colonial policy have been brought out well in a recent study of Indian indentured labour on plantations in the Caribbean.

Agarwal maintains that her arguments on women's class position have been misrepresented. On the contrary what was stated in the review was that while the observation that changes in the women's family and marital status directly impact their economic position was valid, for Agarwal to go on from that and attribute excessive ambiguity and fluidity was both problematic and naive. Class is an eminently powerful element of perceived identity and status, both in the way others see us and the way we see ourselves. In the rural Indian context class and caste distinctions can certainly not be wished away - not even through the setting up of multi-class organisations. In fact the strength of multiclass organisations, including those such as AIDWA, lies in the recognition of these very differences and it is success registered in consciously tilting the balance in favour of women from the oppressed social groups which would turn the women's movement into a multitudinous and potent agency for social change. In the absence of such a perspective the thrust for multiclass or even mixed-sex organisations could easily hijack the slogans of democracy and equality into perverse rhetoric while women's emancipation could become a plank for enhancing the 'rights' of women from the privileged sections. In other words, selective critiques of patriarchy, devoid of the context and content of democracy can become and, have in the past, led to appropriation of the slogans raised by the women's movement for selective gains.

Lastly, while I have chosen to ignore the petty insinuations contained in Agarwal's rejoinder I do wish to put on record my sense of shock and anger at learning from friends that the author had actually made telephone calls to verify or establish the exact nature of my political affiliations. These in fact have never been a closely-guarded secret; nor have I chosen to flaunt them. In fact to the best of my ability, I have tried to use my political vision to expand my intellectual horizon. If Agarwal believes in serious intellectual debate on a free and frank basis then attempts to dismiss questions by resorting to political 'labelling' is hardly a step in the right direction. To set the record straight, Agarwal has written a good book but, I maintain, and I hope, her's is not the last word on the subject.

### Intellectuals, Nation and the People

### S Shukle

TWO basic issues arising from Andre Beteille's very full obituary tribute to S C Dube (EPW, March 30) should not be allowed to be obscured.

Many intellectuals of Dube's generation felt committed to serve the Indian nation and its state, however much some of us may entertain reservations about its character. This position should be demarcated from the one, like the author's, that involvement even as much as Dube's could be legitimate but that the ideology and class orientation is illiberal and conservative, even reactionary from our point of view. Some of us therefore do not choose this involvement, in fact feel committed to and are active in opposing or criticising the state and working against it, in addition to the academic work we might do. Beteille's position does not deny any public role for the intellectual, but it is much closer to his desk and classroom, or much more glued to them - and as a matter of honest conviction, if one may say so, less radical. But to the extent his comments appeared to imply isolation, maybe unintendedly, one has to differ and say Dube's was as much a possible role as any other that Beteille might prefer. Intellectuals' deep and active involvement in the postcolonial states of the second half of this century should be positively responded to and encouraged - and not discouraged even by implication.

The other issue relates to the construction of academic discourse in our country. As pointed out in the initial intervention, radical, non-metropolitan, non-English academic intervention tends to get marginalised through the mechanisms of publication, channels of communication, allocation of positions, including academic positions, which are prevalent. The very structuring of these processes and the formation of attitudes tend to highlight the English language and conservative thought. This is not just a matter of how important Dube or anyonc else is or is not. The question of allocative justice in academia is an important matter by itself on more than one ground - fairplay, health of the academic system, etc, etc. But the issue raised here is, what ideas are helped to dominate or govern academic discourse? Which direction is society propelled in through these academic processes? The very social construction of academic and, therefore, to some corresponding degree social reality is at issue. These are not matters to be obscured by an initial avoidably petulant reaction of - to use the expression already used earlier in this discussion - a 'provincial'-origin academic to, if one might use a corresponding adjective, a 'metropolitan' academic's comments. The privileging of conservative ideas through the metropolitan elite's language, English, and the sidelining of those in Indian languages has already gone too far. Furthering it even more could lead to both more reactionary thought at either end of the social/linguistic scale and deeper social schisms obstructing the path of either serious thought or purposeful social action. It would further advance the process of closer integration of conservative (as well as even radical or progressive) English-speaking/metropolitan intellectuals with the dominant First World. Reflection on what we do with the memory of people like S C Dube and A R Desai - very different from each other except in their marginalisation by the conservative English/metropolitan intellectual Establishment – has to raise basic issues of what is happening to ideas and people in our society. The faults and deficiencies – and who is without any? – of Dube or the intemperate response of Krishna Kumar (perhaps worse than some similar faults of others, perhaps not) apart, one has to do something about this schism and produce – in not quite the Gramscian sense – an organic academic discourse and community which is also an adequate and wholesome social one.

In postscript, one must point out, students of education (the author is also one and had some responsibility for Krishna Kumar also being where in the academic world he is located) also study society with such competence and limitations as are theirs. Some sociologists also study education — a few with very high creativity and competence, others with less.

### **Product Reservation Policy for Small Industry**

### M H Bala Subrahmanya

PRODUCT reservation for small scale industry (SSI) is perhaps the most widely debated among the various policy measures adopted by the government for SSI since independence. My paper [Bala Subrahmanya 1995a] analysed its macro performance over a period of time and brought out that the policy has achieved nothing substantial for SSI. My clarifications [Bala Subrahmanya 1995b] on inferences and conclusions of my paper with reference to Nair's comments [Nair 1995] have been misunderstood and misinterpreted by Nair to a large extent [Nair 1996].

First, about competition. The thrust of my argument is that it is wrong to assume that whatever is reserved for SSI (i) do have economies of scale for SSI and therefore competition among SSI will emerge; and (ii) do not have economies of scale for large-scale production. To substantiate this viewpoint, I quoted that out of the 1076 reserved items, 233 items are not at all produced by SSI and 692 items have negligible presence in reserved SSI output. This shows that these items have really not witnessed the entry of a large number of small producers to encourage competition.

At the same time, it does not mean or imply that the remaining 151 items have economies of scale only for SSI and therefore, competition has emerged and do not have economies of scale for large-scale industry. It cannot be conclusively proved that the 151

items do not have economies of scale for large industry and therefore reservation is justified. The clandestine entry of large units into the manufacturing of reserved SSI items itself brings out that there are many items in the reserved list which are attractive to large units as much as to small units, if not more, in terms of economics of production.

Actually, small-scale enterprises emerge and grow due to three kinds of influences [Anderson 1982]:

(1) Wherever there are locational advantages (i.e., locational influences). (2) In industries which give scope for dispersed processes of production or sub-contracting (i.e., process influences). (3) In industries where products have small total markets or economies of scale for small-scale production (i.e., market influences).

These influences operate at every stage of industrial development. That is why, small-scale enterprises account for a significant share of units, employment and output in all economies, irrespective of the level of industrialisation [Nanjundan 1994]. Given these influential factors, small-scale units will emerge, irrespective of whether an item is reserved or not. Considering these, policies with promotional orientation could play a more effective role in SSI growth than protective measures like reservation.

Reserving an item, which does not have locational benefits, process benefits or market benefits for small manufacturers, will

definitely lead to non-competitive conditions. The statistical evidence that 233 reserved items are not at all manufactured by SSI questions the underlying logic of product reservation policy: "...Reservation provides protection by preventing the creation of fresh capacities in large-scale sector in product lines which are techno-economically highly suitable for being taken up in the small-scale sector" [Development Commission 1992]. In fact, Nair aptly reminds us that it is "the profit-maximising calculus that induces a producer, large or small, to enter an industry. One has to carry out detailed cost-benefit calculations for each such item before drawing any such inference" [Nair 1996]. By inference, Nair says that the government advisory expert committee, which recommends an item for reservation or dereservation, has overlooked these issues. According to Nair, the same holds good for the 692 items which have a negligible presence, in terms of value of output, in reserved SSI. Thus, Nair's rational arguments only substantiate my inference and conclusion.

Nair's assumption about my admission, that the statistics presented by me on the growth of the reserved sector vis-a-vis the unreserved sector can lead to conflicting inferences, is false. In fact, statistics clearly show that the unreserved sector is better off than the reserved sector, though marginally. In this context, it would be worthwhile to quote the findings of Sandesara. Sandesara (1993), who analysed the aspects of growth and structural change of modern small industry, compared the growth and capacity utilisation of reserved SSI with that of unreserved SSI using the two SSI Census. He found that at the aggregate level and in a majority of industries, the performance in reserved items was poor relative to unreserved items.

To quote Sandesara, "since reservation is an additional powerful incentive protecting small industrial units in reserved items from the more favourably placed large industrial units, catering to the same markets, one may expect their performance to be better than that of other small-scale units. However, our statistics suggest the opposite conclusion." He concludes "And thanks to reservation, producers in the reserved items may continue producing for long in the hope that their chances of survival and growth are better there than in unreserved items, so that the condition of poorer performance in the former continues to obtain longer than in the latter items".

To further prove my point, I compared the growth of items which have been under reservation since 1972-73 (Table 6) with the growth of items which were reserved in

1972-73 but were dereserved subsequently (Table 7) [Bala Subrahmanya 1995]. It is clear that it is the dereserved SSI items which grew faster than the reserved SSI items.

To counter my conclusions, Nair compared the growth of dereserved SSI (Table 7) with the growth of items which were unreserved in 1972-73 but were brought into the 'reservation list' subsequently (Table 8) [Nair 1995]. I have brought out the fallacy of Nair's argument in my reply in para 12. But Nair is quite off the mark when he argues that the comparison of Tables 6 and 7 has as little significance as the comparison of Tables 7 and 8(!).

According to Nair, reservation policy is a non-issue. But every government policy has been formulated with a specific objective. Therefore, it makes sense to assess or evaluate the performance of the policy with reference to its objective. Given this, no government policy can be a non-issue. Particularly, product reservation for SSI deserves due attention since it treats SSI and large industry as watertight compartments, without any significant achievement to its credit.

Nair further argued that Desai and Taneja (1990) among others, have produced evidence that reservation is not a significant issue. Perhaps Nair is not aware of their views on reservation brought out in the same paper. Desai and Taneja (1990) in their evaluation of SSI policy, structure and performance, said that "the list is an outcome of political pressures for reservations meeting the resistance of large firms and of bureaucrats afraid of obstructing the realisation of economies of scale." They concluded that "of the present incentives, only the interest concession on loans from official institutions seems worth retaining... The remaining incentives should be abandoned. In particular, market segmentation arrangements, in the forms of reservation, price preference and preferential purchase, appear to have no desirable effect, and some strong undesirable ones." Further Desai and Taneja (1990) pointed out that dereservation would enable the more efficient among the small firms already in the industry to grow. All this cannot be construed as an evidence to say that reservation is not a significant issue.

Finally, according to Nair, my major point in both the paper and the reply is that there is need to keep the reservation list constantly updated on the basis of logic regarding economies of scale and keeping in mind the emergence of new commodities. But nowhere have I so argued, explicitly or implicitly. A government advisory committee on reservation as mentioned earlier, has been functioning for the revision of the list from time to time. The conclusion of my article as also my reply is simple and clear: product reservation policy for small industry manufacturing deserves to be scrapped altogether. Depicting the policy with nationalistic colour is the last resort which one can seek to defend the policy.

### For the Attention of Authors

The compulsion to limit the size of issues on account of steeply rising newsprint and other costs and a sizeable backlog of material awaiting publication lead us to request that papers submitted for publication be not over 10,000 words, including tables and notes and references.

It is helpful if contributions in word-processed format are accompanied by floppy disc copies, in Wordstar preferably. The latter will be returned after use.

# Three simple words every depositor should look for...

### Safety, Strength, Service.

In a world of greater choice and fluctuating returns some features remain constant to a wise decision.

For those who view safety as paramount, both CRISIL & ICRA have re-affirmed our deposits with the highest rating possible: FAAA and MAAA respectively. Which is reflected in our deposit base of over Rs. 3000 crores, over 625,000 depositors and 40,000 agents.

For others who view performance as all-important, our asset base of over Rs. 6500 crores, loan approvals of Rs. 9064.91 crores, Shareholders Funds of Rs. 1501.82 crores, Book Value per Share of Rs. 1219 and Earnings per Share (annualised) of Rs. 176 as of 31st March, 1996, would make pleasant reading.

To us, impeccable service is a hallmark of our existence. It has helped us finance over a million families in over 2300 cities and towns all over India. It will help you place a deposit that is special. So, look for the three simple words, Safety, Strength and Service or just four simple alphabets... HDFC.

### **Planning and Economic Liberalisation**

The Eighth Plan initiated during the period of the structural adjustment programme has been claimed to be a different kind of plan by its authors. To what extent and in what forms precisely has the drive for liberalisation of the economy affected the system of development planning?

2740

### **Urban Development in a Colonial Setting**

Normal capitalist development in the periphery is neither the intended objective nor the end result of colonial intervention. Hegemony for tribute realisation is the major aim. This hegemony and the plunder that it permits make it difficult for capitalist development in a colony to be along the same lines as in the metropolis. Towards the end of the 18th century, Bombay, having been drawn into the vortex of capitalist relations, was assigned its role in the world capitalist system. Through colonial manipulation, Bombay was made the main spatial regulator, in western and central India, for the transfer of tribute to the metropolis.

### Demographic Paradox

The male-female ratio in the total population has long been low in India and has been declining. But the low sex ratio does not hold for all age-groups. The sex ratio has been high among marriageable-age adults and a comparison of population data for India, France and Switzerland points to a demographic paradox. 2730

### **Financial Devolution**

The current balance of political forces, with a coalition of 13 parties forming the union government, affords an opportunity to correct the imbalance in union-state relations and address the question of the devolution of power downwards by the states.

2719

### **Child Marriages**

Child marnages had flourished till quite recently in the backward district of Rajgarh in western Madhya Pradesh. But a concerted campaign by the district administration over the past three years has succeeded in preventing a majority of engagements from culminating in marriages.

2721

### **Painful Transition**

The significance of the events of July 27 in Medan in North Sumatra in Indonesia is not that they mark the beginning of the end of Suharto's so-called 'new order', but that they signal the devastating ways in which political transition in the country is likely to come about.

2726

### Manipulating the UN

While the recent missile attacks on Iraq by the US have been generally acknowledged as a flagrant violation both of international law and Iraqi sovereignty, it is not often recognised that practically all UN actions in northern Iraq since 1991 have been in contravention of international norms. The US and its allies have deliberately misinterpreted UN resolutions to suit their purposes, manipulated UN processes to attain their objectives, taken action in the name of the UN without authorisation and in some instances managed to obtain subsequent legitimisation by the UN. 2760

### Into IMF's Arms

The government's reluctance to take unpleasant measures such as strict enforcement of tax laws and reduction of defence expenditure has compelled Pakistan to rush to the IMF for financial succour 2728

### **Lost Cause**

Although there is increasing evidence that a more equitable distribution of farmland actually leads to higher productivity, land reform has all but vanished from the political-economic agendas of third world countries, including India.

2725

### Tribals and Development

Tribals in the Nagarhole and H D Kote regions of Karnataka have been protesting against development projects sponsored by the World Bank which will result in their large-scale displacement and the destruction of their way of life. 2723

### LETTERS TO EDITOR

### **Different Strokes**

ACHIN VANAIK's article on the CTBT debate (August 24-31) was an informative and comprehensive review of the Indian stand on the issue and on the contrast between the Indian and the Japanese stands on nuclear disarmament. There is no doubt that Japan is the worst sufferer from nuclear weapons and its role in the nuclear debate has been exemparly. It is also true that public opinion in Japan has strongly criticised the continuing development and improvement of nuclear armaments. Vanaik is right in stating that Japan like India has its own border issues and despite those it has been advocating nuclear disarmament and CTBT whereas India has refused to sign the CTBT due to 'security reasons'.

Beyond this, however, I have several differences with Vanaik's point of view. First, to refute Vanaik's charge of "false anti-American credentials by Indian elite", India's objection to CTBT has nothing to do with anti-American propaganda. India has its own reasons for refusing to sign the draft. After all, Vanaik has himself mentioned that there are close trade links between the US and India. If India can co-operate with the US in economic matters why would it try to use the CTBT debate as a forum for anti-American propaganda and what is there to gain from such an action?

Secondly, Vanaik consistently tries to project that the Indian print media are biased and do not provide equal opportunities to anti-CTBT writers like himself. But by his own admission only two of his articles have been rejected since he became a freelancer. one of which was a debate with an individual. Furthermore, he admits that there are many writers favouring the government line (i.e., of not signing the CTBT). Why doesn't Vanaik view it as a popular opinion of the majority? Government itself is representative of the population and the media too are part of the population. Then it is right to say that both express public opinion here in the same way as they do in Japan.

Besides, Vanaik's article is an account of his personal career as a writer and antinuclear campaigner in India. He may have had to face various challenges in his campaign (rumours about his accepting money from the US, etc). But this cannot in any way justify his stand that the nuclear debate in India has been one-sided and ill-informed. It is true that in a democracy every person has the right to speak and express his opinion but it is also true that democracy is a way of government by the majority and it is imperative that the point of view of the majority prevail in the end. (As, for instance, the presence of pro-nuclear armament groups in Japan can't affect the government stand.)

Furthermore, it is not correct to place India's and Japan's security concerns on the same level. India cannot trust the world body in case of aggression from Pakistan or China when the US is providing military assistance to Pakistan despite repeated protests from India and "a section of its own population" and China, despite signing the CTBT, continued to test its arms till the last day and even forced changes in the CTBT draft. Japan, on the other hand, has no such security concerns. Its dispute with Russia over the Kun'le Island has not been very active or public in the recent past. Secondly, depite the anti-American stand by the Japanese public it is true that the US armed forces are at all times ready to protect Japan. Lastly, with the fall of communism in the USSR and a healthy friendship between Yeltsin and Clinton no one can foresee any security threats to Japan from Russia. On the other hand is the US stand on China where America was not able to stop it from conducting frequent tests and had to give MFN status to China despite its economic pact violations. So how can one expect the US to come to the aid of India in the case of a Chinese aggression?

Vanaik instead of giving an account of his personal struggle should have given concrete reasons for India signing the CTBT so that the 'ill-informed' and 'biased' public opinion of our country could have benefited

Anadi Misra

Lucknow

#### **Dubious Stand**

THROWING the nation's security interests to the wind, the Indian government on September 3 ratified a UN convention which prohibits development, stockpiling and use of chemical weapons and calls for their destruction – before a single one of the nuclear weapon states has done so – and is preparing to let the Comprehensive Test Ban Treaty (CTBT) be adopted by the UN General Assembly. In doing this, Indian officials are doing what comes naturally to them – acting as lackeys of the imperialist powers. India's patriotic forces must defeat this move towards slavery.

Rather than renounce its home-made chemical weapons before the nuclear five have done so, India can vastly increase its security, prosperity and self-reliance by immediately and strictly renouncing all further import of military hardware, including new fighter and trainer jets and insisting that the services get only equipment developed and produced within the country with at least 95 per cent indigenous content or do without them, no matter how dire the consequences. Only then is there a chance of India giving up its parasitism and putting in the requisite

effort. Think how many days of how many child labourers weaving carpets go into the purchase of a single jet fighter or trainer for a hundred crore in foreign exchange. Indictoses two such jets each month in peace-time in war with any but the 'coloured' nationately are likely to be as useless as Syria's which lost about 80 of its jets, technically a match for Israel's, for a single one of the latter during the Lebanon war. If you are not resourceful enough, industrious enough nimble enough to design and build such equipment, you do not have the qualities that make up the 'knowledge in depth' to use them

### **Custodial Deaths**

AS is well known, the police and other armed forces of the state as a matter of routine resort to third degree methods against those arrested by them in Andhra Pradesh during the last five years alone 107 custodia deaths have occurred. This is not counting the many people (672 in the same period killed in false 'encounters' with the police The police establishment in Andhra Pradesh has got away with this illegal and amora violence. Not a single police official has been punished till date. It is in this contex that the case of the custodial death o Ramakrishna Reddy at Madanpalle assume: importance. This is one case in which the evidence is strong and the witnesses are firm. Their evidence has already been recorded before the magistrate in the private complaint filed by the Andhra Pradesh Civi Liberties Committee (APCLC) Moreover the post-mortem report is also likely to prove the police guilty.

It is the hope of the APCLC that if the guilty policemen are brought to book in the case it will act as a deterrent to erring police men who resort to third degree methods eve so frequently in police stations throughou the country. The state government and the police establishment should complete their internal enquiry quickly and bring the gulty to book. This would set an example to the rest. Instead, we find local police official: conniving with the accused SIs to thwart the case using all sorts of methods, the lates being the filing of a series of false case: against the workers and the trade union leaders involved in the case and listing then as rowdy-sheeters. We therefore appeal to the readers of your journal to intervene it the matter and see that the police desist from such actions and that the guilty officials are brought to justice.

G NARENDRANATI

Vice-President, APCLC, Chittoor.

### Manipulated Market

FOR anyone familiar with the volatile behaviour of the Indian capital market, its current depressed state should not have come as a surprise. It reflects essentially the impact of certain fundamental factors, some internal to the working of the capital market and others relating to the economy in general. The foremost amongst these is, of course, the speculation driven nature of the market which has made it hyper sensitive, in the present instance to signs of political instability. The growth of the capital market and of the number and variety of players in it in recent years has far outstripped the growth of the real economy. It all began with the authorities attempt around the mid 1980s, to integrate the money and capital markets which encouraged the free flow of bank funds directly and indirectly into the share market. The financial system began to be dominated by a few players with political clout who showed scant regard for the rules of the game. From the other side, the so called equity cult was drummed up by some of the larger companies, such as Reliance Industries to avoid supervision and control by banks and financial institutions. These developments culminated in the Haishad Mehta boom. Share prices tumbled when the bubble burst in duc course but speculation was again stimulated by the emergence on the scene of foreign institutional investors (HIs) Within a period of about two years by early 1994, share prices had pierced the Harshad Mehta peak. Since then the Ells their attitude towards the emerging markets and their assessment of financial and political risks have dominated the Indian stock markets

The HIS initial influx boosted market operations to dizzy heights. The BSE Sensex touched a peak of 4,588 with a price carning ratio of over 49 it the end of August 1994 having overtaken the Harshad Mehta record of 4,506 achieved at the beginning of April 1992 Primary issues of share capital by private sector companies, which had been of the order of Rs 5 757 ctore in 1991-9? shot up to Rs 19,825 crore in 1992 93, Rs 23 275 rote in 1993 94 and Rs 27,261 crore in 1994 95 The period saw a series of measures to boost the capital market as part of the liberalisation of the economy establishment of the National Stock Exchange (NSE), enlistment of a large number of brokers (over 1,000 were registered with the various stock exchanges) and the emergence of an army (some 2 lakh) of sub-brokers, registration of nearly 400 FIIs, 37 foreign brokers and more than 510 merchant bankers by the SEBI and, above all, the listing of shares of public sector banks and other PSU undertakings. All these developments contributed to expansion of activity in the capital market way beyond what was warranted by the growth of the real economy

Significantly the mind boygling growth of the capital market has taken place during a period when there was hardly any rise in the rate of domestic gross investment, which fluctuated between 21 and 24 per cent. Even household saving in the form of financial assets has generally stagnated around 10 per cent of GDP. Private corporate sector investment showed only a small increase from 5.9 per cent of GDP in 1991 92 to 6 6 per cent in 1994 95. Against this backdrop, the level of operations in the capital market, even under the present supposedly depressed conditions, cannot be considered low From less than Rs 10 000 crore in the early 1990s, the size of the primary market comprising share issues and bond flotations by companies and funds raised through PSU bonds exceeds Rs 40,000 crore a year now. In the secondary market, the market capitalisation of seven PSU shares (SBI, IDBI, ICICI, MINI, SAIL, HPC Land BHFL) which were not available to investors a few years ago, amounts to about Rs 60,000 crore or nearly 40 per cent of the capitalisation of the BSE Sensex scrips. Despite the current fall in prices of major scrips, overall market capitalisation of BSF-listed companies, which had stood at Rs 189 405 crore in March 1993, Rs 344,462 crore in March 1994 and Rs 446 884 crore in August 1994, touched Rs 585,919 crore in April this year and was still Rs 497,113 crore in August. This is the result of the inclusion of PSU and other new scrips. Between August 1994 and August 1996, the BSL Sensex fell by 23 per cent but m irket capitalisation of BSF listed shares rose by 11 per cent. To take a different period between March 1993 and August 1996, the BSF sensex rose by 47 per cent but market capitalisation of BSF listed shares went up by 162 per cent

Therefore the despondency over the state of the capital market needs to make allowance for the fact that the size and tange of investment options available to players in the market, including the debt market have expanded beyond recognition. As a result, some decline in the prices of traditional scrips was only to be expected. The ordinary investor's disenchantment with the market is attributable to two factors, the questionable practices continued to be indulged in by the major players and the market element of unpredictability and volatility introduced by the operations of the FIIs. The quantitative growth of the market has not been accompanied by a corresponding improvement in the quality of operations. The promised control over speculation and greater transparency of operations have not materialised. On the contrary, all the major stock

exchanges have suffered drastic reductions in delivery-backed trading. The NSE has certainly not been an exception to this. In the case of the Bombay Stock Exchange, only 21.9 per cent of trades contracted resulted indeliveries in 1995-96, compared with 39.4 per cent in 1994-95. What is particularly disheartening is the fall in the ratio from 52 per cent in 1994-95 to a mere 17.9 per cent in 1995-96 in the case of the NSE, that is, below even that for the BSE. The comparable decline in the case of the Delhi Stock Exchange was from 35.8 per cent to 12.7 per cent and of Calcutta from 10.6 per cent to 4 per cent.

The number and variety of questionable practices on the stock exchanges, even those which have come to light, are mindboggling, ranging from irregular price fixing of initial issues to trade in duplicate shares and outright price-rigging. The SEB1 has blamed merchant bankers for the flood of public issues by shady promoters, but under the spell of liberalisation the SEBI had itself allowed the registration of a large number of merchant bankers without proper scrutiny. Now the SEBI has been compelled to launch an investigation into the whereabouts of some 382 companies that had come out with premium issues in 1994-95. Around 1,000 companies are reported to have disappeared after issuing capital in the past two years. The BSE has identified as many as 1,234 cases of price-rigging since just January this year and SEBI has apparently found NSE brokers indulging in the same irregularities as BSE brokers: failure to issue contract notes for all transactions or, while issuing contract notes, not obtaining clients' consent, dealing with unregistered sub-brokers and not segregating brokers' accounts from clients' accounts. SEBI has had to suspend the entire Pune Stock Exchange (PSE) board for allowing illegal badla transactions and evasion of margins by member-brokers, including PSE board members. Most recently we have the example of the FIIs manipulating the price of State Bank of India shares prior to the latter's GDR issue with the objective of picking up the GDRs at lower prices. The circulation of duplicate shares has been the most blatant of irregularities; likewise, the involvement of the UTI, LIC and GIC in the private placement of Reliance shares. It has taken the SEBI almost three years to castigate the investment institutions for their role in the Rs 1,000 crore private placement of shares of Reliance Industries. Despite all the evidence of wrongdoing, Reliance Industries was permitted to shift its registration from the BSE to the NSE when the former sought to take action against the company in the duplicate shares case. The recent speculative fervour in the stock exchanges has been stoked by the ebb and flow of investment by the PIIs. Based on the yield levels prevailing in the industrialised countries, the FIIs moved to the emerging markets in a big way in 1993 and 1994. The Mexican fiasco made them withdraw from these markets for a while and Indian share prices collapsed for the most part of 1995 because of the FIIs' lukewarm interest. During the first half of 1996, the FIIs increased their net investment by more than a billion dollars and share prices rose by about 30 per cent during January to June. Thereafter the FIIs reduced their net investment from \$ 356 mn in June 1996 to \$81 mn in August and \$ 123 mn in September, which has been not a little responsible for the depression in share prices during this period.

The manipulation by bears and bulls in the stock exchanges is thus to a great extent reinforced by the bearish or bullish view taken of the Indian markets by the FIIs. Between the end of June and early October. the BSE sensex fell by 16 per cent and the NSE-50 by 18 per cent. Indian companies' GDR prices have already touched rockbottom levels. Shares of as many as 1,500 companies are quoted below Rs 5, of them about 500 below Rs 2. Out of 6,802 listed scrips only 1,531 (22.5 per cent) were traded on almost all trading days of September, whereas 2,124 were not traded at all. The acute concentration of trading is evident from the fact that just 8.2 per cent of the scrips listed at the BSE accounted for 87.3 per cent of the total value of trading in September. In fact the top five scrips accounted for 80 per cent of the trade on the BSE in September.

The decline in share price indices during the past few months reflects to an extent the disenchantment of the common investor with company shares as an avenue for investment. What is required, however, is not more fiscal and financial incentives. but improvement of the functioning of share markets and genuine transparency in their operations. Despite some of the actions taken by the SEBI, the credibility in regard to the operations of brokers on the stock exchanges has hardly been significantly enhanced. Finance minister Chidambaram, in a recent meeting in New York, sought to appeal to the FIIs "to work closely with the Indian stock broking community and woo the small investor back into the market". He further said that "it is really up to the players in the market - the merchant bankers, FIIs. brokers and regulators - to do something and welcome the small investor back". While the infirmities of the market are indeed responsible for the slump in share prices, Chidambaram's lament that he "cannot see any fundamental weakness in the economy, yet the market keeps going down" flies in the face of facts. For whatever be the reasons for the behaviour of share prices, there is no gainsaying that there is much cause for anxiety on the macroeconomic front. The share markets may not generally behave in a rational manner, but some of the basic causes of anxiety on the macro-economic front are playing a role in depressing share prices as well. The deceleration in the growth of industrial output, large stock-piling of finished products, reduced investment as a result of usurious real rates of interest and unappetising corporate results partly reflecting heavy interest costs are all serving to depress the share market. There is also the destabilising influence on the stock markets of the overall economic and financial policies of the government. In the first place, as already mentioned, the presence of the FIIs with their fast moving funds has been a major source of volatility. Secondly, the monetary and institutional measures, which promote the free flow of funds between the money market and the capital market, contribute to speculation and instability in share prices. These two factors are responsible for generating exaggerated expectations among investors of windfall gains from investment in the capital market. It is in the larger interest of share market stability and enduring investor interest that such expectations are not further stimulated. Finally, the government's present monetary policy in general and interest rate policy in particular cannot but curb corporate investment and pull down companies' financial performance and thus tend to dampen share prices. From the point of view or better corporate governance of manufacturing firms and more disciplined use of investible resources, it is essential that in the financing of the corporate sector the emphasis remains firmly on a system of provision of investible resources by commercial banks and termfinancing institutions rather than on share market-based provision of equity and even debt funds.

#### PHARMACEUTICAL INDUSTRY

### **Playing with Lives**

THE series of events following upon the discovery that a brand of antibiotic tablets (Comsat Forte) manufactured by Boehringer Mannheim India, the multinational pharmaceutical company, were contaminated and reportedly caused the death of at least two people and seriously affected several others has exposed not only the degree of negligence in the manufacturing norms of pharmaceutical companies, but also the pathetic lack of control of the FDA over the drug companies.

The tablets, an extensively used widespectrum antibiotic combination of sulfamethaxozole and trimethoprim, had been distributed to patients who had undergone cataract surgery at an eye-camp at Ahmednagar on August 16. Following complaints of adverse drug reaction more than 62 people had to be hospitalised three days after. The FDA, which seized the remainder of the drugs, took almost 15 days to analyse the material. It found that the tablets had been contaminated with an antidiabetic drug, glibenclamide, which drastically reduces blood sugar levels and is administered to diabetics. Only then did it issue a notification to Boehringer Mannheim India to recall the drug within 72 hours. According to the FDA commissioner, to the extent that glibenclamide can cause hypoglycemia and is potentially lifethreatening, it was poisonous. There were at that time over four lakh tablets of Comsat Forte in the market in India. Given the fact that it was a widely used drug and that in India adverse drug reaction machinery does not exist, an immediate alert should have been sent out with notices in the media warning people about the drug. Nothing of that sort was done; instead the company (and it would appear the FDA) did its best to keep the issue under wraps.

Although the company agreed to withdraw the drug, it did nothing about letting the public know the facts. It contended instead that its own tests of control samples did not reveal anything incriminating. The company also requested the FDA to extend the timelimit by when the drug had to be withdrawn from the market. The FDA does not appear to have had any qualms about agreeing to extension of the deadline, to September 5, for a potentially life-threatening drug to be withdrawn from the market. This is surely an action that needs serious investigation, but even by September 5 the recall process had not been completed and some 20 per cent of the tablets were reportedly still in circulation.

Meanwhile, in Kolar at yet another surgical camp for cataract treatment, two persons died and 11 others became seriously ill after consuming these tablets. There is no explanation to date of how these tablets, which must have been purchased/procured in bulk, came to be distributed at the camp despite the reported recall notice sent out by the company. It took another nine days for the FDA to issue a show cause notice to the company seeking an explanation about the contaminated tablets. Two days later, on September 21, the company halted production of its entire Thane unit near Mumbai, one of the plants manufacturing Comsat Forte.

This is the first part of the story which raises several issues: Why did the FDA not

insist on the company issuing a notification about the product immediately in the media? Surely, protecting consumers of Comsat Forte from taking a product suspected of being contaminated should have been the first and foremost task of the FDA? Second, it is obvious that the company did not act in the interest of the consumers of its products. Even if the tests that it had conducted contradicted the FDA's findings, as a measure of safety it should have, if public safety was a concern, made the facts widely known at whatever cost. Would the company have been allowed to get away so lightly in its home country where both public reaction and the state machinery would have ensured otherwise? Third, had the FDA and its inspectors been doing their job, would such a situation have arisen at all? And was Boehringer Mannheim following the good manufacturing practices which the drug controller, the industry and especially the OPPI and the MNCs have been so vociferously advocating? This last is significant, especially in the context of the recent demand by MNCs, supposedly in the interest of public safety, for protection against the "reckless pirating of their products" by small Indian companies. The MNCs' old argument has been that no Indian company, certainly not the small ones, can match their quality control. Not surprisingly, the OPPI has not issued a single statement about the Bochringer incident.

The second part of this story has to do with the actions and the inactions of the FDA and the company. The workers of the Thane unit, now shut down, have alleged that the company is resorting to this measure as a first step in closing down the plant. They point out that such moves have been in the air. In any case, why should only one unit be closed when the drug was being manufactured in other units as well? There is some validity in their argument that the quality assurance manager and the procurement personnel should have been apprehended and investigated immediately. The manager of the unit had contended that the company was waiting for an investigating team to come from Germany. The FDA is yet to lodge criminal complaints against either the MD or other heads of division, nor has it as yet cancelled the production licences of the company for the drug.

Undoubtedly, there is an ongoing process of 'rationalisation' in the MNC drug sector following the liberalisation of the industry. And drug companies would not be averse to using any opportunity to close down low-profit lines and units. On the other hand, by and large, pharmaceutical workers have kept away from the drug consumer movement and have chosen not to involve themselves in

issues of public safety vis-a-vis drugs. Even in this particular case, it is curious that the union appears to be largely silent on the issue of poor quality control norms which allow such contamination to occur or on the company's negligence in not withdrawing the drug immediately after the first incidents occurred. In such circumstances, the workers may find it difficult to get support from those sections which have a stake in ensuring that MNC's do not resort to winding up production of low profit but essential drugs, replacing them with higher priced newer drugs, as is likely to be the trend in the context of the new patents regime. In fact, even if the FDA cancels the production licence for Comsat Forte, there should be adequate safeguards to ensure that the company does not replace it with newer high priced similar compounds. But that is unlikely to happen.

#### **POLITICS**

### **Murky Goings-On**

WHILE prime minister Deve Gowda may have his own personal problems that prompt him every now and then to snuggle up to his predecessor Narasimha Rao, he stretches it too far when he interferes with the legal process to protect Rao from prosecution.

Recent developments pose serious questions about the way the prime minister is operating in the several cases relating to Rao's alleged crimes To start with, there was this mysterious meeting between Deve Gowda and the Supreme Court chief justice A M Ahmadi, in the midst of speculations about Rao's possible arrest on September 30 in the Lakhubhai Patel cheating case, Soon after the meeting, the Delhi police made an appeal to the Supreme Court to shift the venue of Rao's trial from the Tis Hazari courts (where the hearings were being held) to some other place so that better security could be provided to Rao if he was to personally appear before the special judge who was trying him. The Supreme Court promptly passed an order relieving Rao from the requirement of personal appearance before the judge.

Not totally satisfied with this assurance from the apex court, the union law minister Ramakant Khalap (under Deve Gowda's direction) asked the CBI director Joginder Singh not to oppose the bail plea, if Rao's counsel chose to make it, before the special judge. When this was conveyed to senior counsel Gopal Subramaniam, who was representing the CBI against Rao, he resigned in protest.

The Supreme Court's decision to relieve Rao from personal appearance, coming as it did soon after the Deve Gowda-Ahmadi

meeting, has quite understandably cast doubts on the independence of the judiciary and the reputation for 'judicial activism' recently acquired by the judiciary is likely to be tarnished. It is not surprising therefore that the agitated members of the Supreme Court Bar Association have come out with a resolution stating that "in all fairness, the chief justice of India should have avoided the meeting keeping in view the highest tradition of the august institution". Referring to the meeting - "particularly when so many sensational matters" involving "high functionaries" were pending before the Supreme Court - it said that it had put "a question mark on the independence of judiciary". Meanwhile, the Delhi High Court Bar Association has, in a resolution adopted unanimously, condemned the law minister for issuing the directive to the CBI not to oppose Rao's bail plea.

The prime minister is fond of repeating the cliche "the law should be allowed to take its own course". Now that the law, in taking its own course, is closing in upon Rao, why is Deve Gowda panicking? He is bending over backwards to protect Rao and prevent any harm that may happen to him through the legal process. Is it the fear that the Congress might pull the carpet of support from under his chair if Rao is prosecuted? But such fear, in spite of the bragging of Sitaram Kesri, the new Congress president, is unfounded, since the Congress is today a divided and sinking ship. No Congress MP is willing to bring down this government and face another election immediately for the sake of defending Rao.

Besides, even if his government falls because of Congress withdrawal of support due to the prosecution of Rao, it might improve Deve Gowda's image — which is fast declining due to his political indiscretions (such as meeting Bal Thackeray, travelling in an aircraft owned by Reliance and in the company of liquor baron Vijay Mallya, giving the status of a cabinet minister to Narasimha Rao, etc). He can project himself as a victim, who lost his prime ministership for allowing the courts to punish a corrupt politician, instead of sticking to power by protecting the latter.

### **AFGHANISTAN**

### **Invitation for Interference**

THREE months ago, when Gulbuddin Hekmatyar, leader of the Hizb-e-Islami which had been ranged against the Burhannudin Rabbani government, decided to throw in his lot with the latter, commentators were inclined to believe that there was some chance of stability in Afghanistan, even if it was for

only a short time. But in retrospect that probably was the point when Rabbani's efforts at keeping the fundamentalist forces at bay had reached their nadir. Rabbani's attempt to neutralise the other fundamentalist groups by inducting Hekmatyar into the government and, equally important, by encouraging some degree of Islamisation did not, it is now clear, succeed.

The manner in which the Taliban forces have overrun large parts of the country and captured Kabul indicates that not only are the forces well-equipped, but that there was a degree of support from among those in government. That they were well-equipped and possibly trained by Pakistan's ISI has been widely reported. Pakistan itself has made no bones about extending immediate recognition to the Taliban government, which again is not surprising given that the Rabbani government had not been wholly inclined towards Pakistan and had instead sought to establish friendly contacts with India and Iran as well. What is also not surprising is that the US which less than a year ago had sought to support Rabbani in his efforts to quell the Taliban forces should have immediately recognised the Taliban government. And it is this reestablishment of a Pakistan-Afghanistan-US axis that has put the Indian government in a quandary.

So much so that the government has not even reacted to the brutal manner in which the Taliban government has dealt with Najibullah. Apart from this the dilemma is real enough. That dissemination of arms has taken place from across the border via Afghanistan has been well-documented even

by the Sipri. Now with Pakistan's close links with the regime in Kabul, it will be even more difficult to monitor the arms inflow. Pakistan has taken it upon itself to smoothen things for the new government. It has sent a special envoy to Tajikistan, Uzbekistan and Turkmenistan to discuss developments in Afghanistan, even while reiterating that it has not been "behind the Taliban or assisted the Taliban". Russia has been equally disturbed by the developments, and has called a special meeting of the Commonwealth of Independent States in Kazakhastan, specifically with the objective of preventing any spill-over of Islamic radicalism. Significantly, Turkmenistan, where American-aided projects are under way to supply natural gas to Pakistan, did not attend the meeting. The Russian prime minister has categorically stated that his government would not extend recognition to the Taliban regime in Afghanistan. The Kazakhastan meeting has warned the Taliban that the CIS would not hesitate to use force if the Taliban crossed into the former Soviet territories and has said that in that event the CIS would provide support to Taliban's main opponents. Meanwhile the Taliban militia has dismissed the Russian warning and has continued to push further north.

It is unlikely of course that the Falikan forces will venture beyond Afghanistan, unless there is adequate support either from neighbouring states or from powerful external forces. Nevertheless, the Indian government's fear that the new developments might see a revival of external interference in the region may not be quite fanciful.

### CURRENT STATISTICS

#### **EPW** Research Foundation

The government's monetised deficit in particular its recourse to ad hous has shown a dramatic fall but it has been replaced by investment in government paper by commercial banks. Banks are flush with deposits but their advances continue to show in absolute fall. Share price indices have declined by about 12 per cent over the past one year inflecting the persistence of depressed conditions in the capital market. The growth of industrial production during April June has slowed down to 8.5 per cent from 14.6 per cent in the comparable period of 1995. The deceleration has been particularly sharp in the infrastructure industries. I aport import growth has come down likewise, generally reflecting sluggish economic activity.

TELCO

### **Fruits of Investment**

THE largest manufacturer of commercial vehicles in the country, TELCO, has really bounced back after its dismal performance in 1992-93. While its net sales have more than doubled since then to Rs 6,718 crore, net profit has jumped from around Rs 30 crore in 1992-93 to Rs 506 crore in 1995-96. The company has managed to keep its cost of finance under control during a period when there was a dearth of liquidity and has actually managed to reduce interest charges by 1.2 per cent over the previous year.

Encouraged by its excellent performance, the company issued bonus shares in the ratio of three shares for every five shares held during the year under review. In addition, it has also maintained the dividend at the previous year's level of 60 per cent on the increased equity entailing a dividend outgo of Rs 143 crore (1994-95: Rs 80.7 crore).

The company has not only benefited from the increase in demand for its products but has also earned the rewards of correct policies during the lean years. It had constantly stressed fixed assets formation and doubled its fixed assets base between 1992-93 and 1995-96. Rise in gross fixed assets formation during the year was 35.5 per cent. The 28.7 per cent rise in inventory is more due to a sharp rise in production than due to a lack of demand - inventory accounted for 14.7 per cent of net sales against 16 per cent last year. Sales volumes in the year under review increased by 31 per cent to 1,81,200 vehicles over the previous year while domestic sales of medium/heavy commercial vehicles (M/ HCV) and light commercial vehicles (LCV) increased by 27.7 per cent and 15.1 per cent, respectively. The company increased its market share in the M/HCV segment from 71.8 per cent to 72.7 per cent and in the LCV segment from 58.8 per cent to 62.4 per cent. The Tata Sumo, introduced during the year, has received an overwhelming response and the company diverted the capacities earmarked for the Sierra and Estate models to cater to the increased demand.

The company has invested Rs 220 crore in the equity of group companies. Significant among such investments were Tisco (Rs 121 crore), Tata Sons (Rs 68 crore) and Tata Cummins (Rs 31 crore). Its stake in Mercedes Benz India cost the company another Rs 84 crore.

Though the company continues to remain a net foreign exchange earner and exports have risen by 9.7 per cent during the year, a sharp rise of 82.7 per cent in imports could be a cause for concern. Net forex earnings have fallen and foreign exchange outgo accounted for up to 8.3 per cent of net sales while foreign earnings accounted for 9.4 per cent.

Meanwhile the company's small car project, which is expected to produce the country's first indigenously developed car, has reportedly made substantial progress.

The joint venture with Daimler Benz christened Mercedes Benz India, has received encouraging response. With a sale of 387 cars till March 1996, it has reportedly managed to notch up sales of up to 1,500 cars to date.

TELCO has drawn up ambitious capital expenditure plans over the next five years amounting to Rs 4,000 crore. Aimed at further increasing its capacity from 2,00,000 vehicles per annum to over 4,00,000 vehicles per annum and the creation of production facilities for 1,75,000 small and medium sized cars per annum, the expenditure will be partly financed through the company's recent \$ 200 mn GDR issue. The issue, oversubscribed 1.5 times, was priced at \$ 14.25 per GDR which is equivalent to Rs 508.16 per underlying ordinary share.

Meanwhile, continuing its outstanding performance, the company has achieved a sale of 46,254 vehicles representing sales of Rs 2,091 crore in the first quarter of 1996-97. The company enjoys an excellent rapport with the stock market as can be seen from the high price to carnings multiple of 21.4 (1995-96 earnings per share).

**ASHOK LEYLAND** 

### **Ambitious Plans**

The flagship of the Hinduja group, Ashok Leyland, saw a 34.5 per cent increase in net sales in 1995-96, reflecting the buoyancy in the automobiles industry. The credit squeeze in the economy seems to have had a marginal impact on the commercial vehicle segment of the industry mainly due to the increase in freight rates, making this business more viable. Operating profit increased by 59.5 per cent over the previous year and net profit by 60 per cent in spite of higher interest charges (up 31.8 per cent), depreciation provision (up 39.4 per cent) and a tax provision of Rs 20.5 crore (1994-95 nil). Gross value added was also higher by 28 per cent in 1995-96 and the percentage of operating profit to gross value added rose from 70.6 per cent in the previous year to 87.9 per cent in 1995-96. Return on investment increased from 5.7 per cent to 7.7 per cent during the year and the company continued its policy of ploughing back a major part of its net earnings (up to 58 per cent). However, with the company increasingly resorting to loans (up 50 per cent over the previous year), total debt as a percentage of equity has increased from 48.9 per cent 63.6 per cent. Though inventories have increased by 42.2 per cent over the previous year, they have risen in proportion to net sales.

The Madras-based company has six manufacturing units located in Ennore, Hosur, Uppal (Hyderabad), Madras, Bhandara and Alwar. These units produced a total of 37,901 vehicles and 6,557 engines during the year under review as compared to 30,412 vehicles and 5,275 engines in the previous year, representing an increase of 24.6 per cent and 24.3 per cent, respectively. The company saw a 29 per cent rise in sale volumes at 37,399 vehicles and a 24 per cent increase in sale of OE-auto/industrial and marine engines at 6,537 units over the same period. The new Cargo range of vehicles, models 709 and 909, have reportedly been well received in the market and it even managed to export 553 of the 3,000-odd vehicles of these models manufactured during the year under review. The Leyland range, according to the company, will eventually be replaced with the Cargo range. Total exports of the company, which account for up to 10 per cent of net sales, touched 2,588 vehicles and export earnings increased by 36.4 per cent over the previous year. On the other hand, imports (accounting for 7.7 per cent of net sales) fell by 12.9 per cent over the same period from Rs 161 crore in 1994-95 to Rs 140.2 crore in 1995-96.

Meanwhile the truck major, second only to Telco in market share, has drawn up ambitious plans for the next six years. As per the plan, the company intends to convert its Alwar plant for building buses and talks have already been initiated with its collaborators Iveco for this purpose.

During the current year, 1996-97, the company plans to introduce up to 1,000 14-tonne category vehicles and up to 500 16-tonne category vehicles in the Cargo range. Another 1,500 vehicles will be targeted for exports.

The company has set a target of producing 50,000 vehicles in the current year. It also plans to enhance its Cargo range manufacturing capacity to 10,000 vehicles this year and later to 25,000 vehicles per annum and possibly to 31,000 units by the end 1997-98. The company has a strong presence in Sri Lanka and intends to enter new markets such as South Africa, Egypt and Kenya in the current year.

Meanwhile, the company's stock quoting at Rs 102 on the Bombay Stock Exchange, discounts the 1995-96 earnings per share of Rs 9.5 by 10.7 times.

BSES

### **Exciting Prospects**

The Bombay Suburban Electric Supply Company (BSES), the only distributor of electricity to northern Mumbai, has shown

| -    | <del></del>                                              |                 | ******          |                                         |                |                |                |

encouraging performance for 1995-96. While sales revenue went up by 29.3 per cent over the previous year, operating profit increased by 70.4 per cent. With raw material costs as a percentage to sales falling from 78 per cent to 64.8 per cent, the operating margin has received a boost from 15.6 per cent last year to 20.5 per cent in the year under review. Net profit too increased by 37 per cent over the previous year. The lower increase in the bottomline was due to the huge increase in interest charges (up 470.2 per cent) and depreciation provision (up 210.9 per cent). Following the commissioning of the company's new units at Dahanu, these expenses could no longer be capitalised and had to be charged to the revenue account.

Sales of electricity to its licensed area increased by 11.8 per cent, crossing the four-billion unit mark while distribution losses were cut down significantly from 13.9 per cent last year to 12.5 per cent. Though the two new 250 MW units at Dahanu managed to contribute up to one-billion units to total electricity generation, only about 50 per cent of this could be transmitted to Mumbai due to the lack of receiving facilities in the city. Thus up to 50 per cent of electricity generated at Dahanu had to be supplied to the Western Regional Grid (WRG) which meant lower realisations.

To cater to the growing demand for electricity within the country, BSES plans to set up more units in different parts of the country. To this end it plans to set up two fast-track projects of 40 MW each near Trivandrum and Cochin and has submitted bids foraward of other medium-sized projects in Andhra Pradesh. It was also selected (on a competitive basis) to manage the distribution of electricity to a zone comprising Bhubaneshwar, Cuttack and Dhenkanal in Orissa.

During the year under review, the company's \$ 125 mn GDR issue (including a \$ 25 mn green-shoe option), received excellent response with the company garnering up to \$800 million in applications. The company plans to utilise the funds from the issue for strengthening its distribution system and for financing the Dahanu projects and corporate restructuring.

With the setting up of two state-of-theart 220 KV receiving stations at Ghodbunder and Versova, the new units will now be able to supply 100 per cent of their output to the company's licensed area. Also, a third receiving station is fast nearing completion.

The outlook for the company is promising with a huge demand-supply gap in the power sector. Reflecting the long-term prospects of the company, its share currently quotes at Rs 164 - 13 times its 1995-96 earnings per share.

### Finance Commission in a Federal Set-Up

Vinod Vyasulu

The current balance of political forces, with a coalition of 13 parties forming the union government, affords an opportunity to correct the imbalance in union-state relations and address the question of the devolution of power downwards by the states.

IN the last few years, India has become a highly centralised economy. Although the country is a union of states, with clearly defined roles for each constituent unit of the union, in effect, the governmental system has taken on the characteristics of a unitary nation. This is a result of the political events that have shaped the nation and the way in which political parties have reacted to them. It has also set in motion opposing forces.

Consider the use of Article 356 of the Constitution. Under this article, the president on the advice of the union government, may dismiss state governments. This provision has been frequently abused. The Supreme Court has found that this article has been misused: the most famous case relates to the dismissal of the Bommai government in Karnataka. The present union government, in which Bommai is the minister for human resource development, has promised to change this situation, with a constitutional amendment if need be. It needs to be debated whether it is an amendment, or political restraint that is needed in these cases.

Apart from this, there has been the routine supersession of local bodies like panchayats and municipalities. The failure to hold elections to co-operatives that have been taken over has resulted in the federal nature of the polity being seriously compromised. The powers of the registrar of co-operatives, given to that office in colonial days, have been used to create this unhealthy situation well after independence. This is in the states which too have tended to centralise powers in their own ways. In fact, it is a travesty of the co-operative spirit that a department of co-operation and thus a minister of co-operation even exist. The infusion of government funds has made the situation worse.

The complex procedures that have been set up for the sanctioning of various development projects have resulted in decisions being referred routinely to Delhi in all kinds of things. Over more than 10 years there have been discussions about the need to reform union-state relations. The Justice Sarkaria Commission made many considered recommendations after careful study. These recommendations, which were very conservative in nature, have remained all these years as just recommendations.

This has resulted in union-state tensions increasing, and pressures of different kinds

building up. The point has also been made that devolution of powers in this context often refers only from the union government to the states. But it is essential that the states in turn devolve power downwards too. This has not been often done. Parliament has taken up this issue by amending the Constitution (73rd and 74th amendments) so that local bodies - panchayats in the rural areas and nagarpalikas in the urban ones - get their constitutional place under the sun. But this in itself is not enough, as the convoluted experience of panchayatı raj in Karnataka in the last decade clearly shows In this context, however, some of the parties now wielding power in Delhi have a, if not positive, then at least a non-negative, record. An opportunity to build on this base now exists.

In the current context, with a coalition of 13 parties forming the union government, an opportunity has arisen to correct this imbalance in union-state relations. These parties have so many contradictions among themselves that the only way forward is for them to agree on general principles on the basis of which decisions can be taken. A start has been made with the formulation – yes, hurriedly; yes, after the elections; but yes – of a common minimum programme on the basis of which the United Front government will rule the country

The point again is not that the country needs a constitutional amendment, but that the country has to give the Constitution a chance by acting with restraint in the political arena. The current balance of political forces is in favour of such an end result, although that may not be the intention of the actors themselves. For example, it is today next to impossible to amend the Constitution, as the required majority is unlikely to materialise unless a consensus across parties exists.

One opportunity for this is in the sphere of financial relations between the union and the states. At present, these are governed by (1) the awards of the Finance Commissions set up every five years, and (2) by the Plan transfers under the aegis of the Planning Commission. While the system has worked over the years, there have been stresses and strains in the federal system.

The Finance Commissions are governed by Articles 280 and 281 of the Constitution. These read as follows:

280 Finance Commission - (1) The president

shall, within two years of the commencement of this Constitution and thereafter at the expiration of every fifth year or at such earlier time as the president considers necessary, by order constitute a Finance Commission which shall consist of a chairman and four other members to be appointed by the president

(2) Parliament may by law determine the qualifications which shall be requisite for appointment as members of the commission and the manner in which they shall be selected.

(3) It shall be the duty of the commission to make recommendations to the president as to - (a) the distribution between the union and the states of the net proceeds of taxes which are to be, or may be, divided between them under this chapter and the allocation between the states of the respective shares of such proceeds; (b) the principles which should govern the grants-in-aid of the revenues of the states out of the Consolidated Fund of India; ((bb) the measures needed to augment the consolidated fund of a state. to supplement the resources of the panchayats in the state on the basis of the recommendations made by the Finance Commission of the state; | [(c) the measures needed to augment the consolidated fund of a state to supplement the resources of the municipalities in the state on the basis of the recommendations made by the Finance Commission of the state, [(d) any other matter referred to the commission by the president in the interests of sound finance (4) The commission shall determine their procedure and shall have such powers in the performance of their functions as parliament may by law confer on them.

281 Recommendations of the Finance Commission – The president shall cause every recommendation made by the Finance Commission under the provisions of this Constitution together with an explanatory memorandum as to the action taken thereon to be laid before each house of parliament. Parliament did enact a law in 1951 (Act 33), called the Finance Commission (Miscellaneous) Act, 1951 Clause three of this Act reads as follows

Qualifications for appointment as, and the manner of selection of, members of the commission -The chairman of the commission shall be selected from among persons who have had experience in public affairs, and the four other members shall be selected from among persons who - (a) are, or have been, or are qualified to be appointed as judges of a high court; or (b) have special knowledge of the finances and accounts of the government; or (c) have had wide experience in financial matters and in administration; or (d) have special knowledge of economics.

The Act, while referring to the manner of selection of the members, does not specify any procedure whatsoever by which they may be selected. In fact it is interesting that the clause simply says they "shall be selected from among persons" who have specific types of experience. It does not say any more about

that selection process. It does not elaborate whether some one, or some agency, will 'select' on behalf of the president or whether he will do it by himself, as he deems fit.

Since Article 280 empowers the president to appoint the commission by order, and since the Finance Commission (Misc) Act of 1951, passed by parliament under this article, does not elaborate on the manner of selection of the members of the commission, it would appear that the president has complete discretion in this matter.

'Complete' is an all encompassing word that requires, if not qualification, at least some explanation. The president cannot be seen to act in an arbitrary manner. This is especially so in view of the fact that the Constitution felt the need to empower parliament to pass an act in this matter rather than leave the matter solely in the president's hands. To data parliament has not felt the need to act further in this matter, but that could well change. The new Janata Dal led coalition union government has promised a great deal in its common minimum programme, on decentralisation and the proper definition of the rights of the states. A debate on these issues is therefore essential.

In the constitution of the Finance Commission, it would appear that the president has been acting hitherto on the advice of the union council of ministers headed by the prime minister. Under the amendment to Article 74, he is bound to act by such advice, subject to some limited freedom.

So far, 10 Finance Commissions have been set up. They have done remarkable work and made major contributions to the theory and practice of public finance in this country. This is something we must be proud of and must clearly recognise and acknowledge. In raising some fundamental questions today, the intention is not to denigrate, or to deny these important contributions, but to ask if, in the context of the changing times, the open matter of the procedure for the selection of members of the commission does not ment a second look. This becomes even more important if we recall that there was litigation around the fact that the Tenth Finance Commission did not have a full complement of four members for some time. A member had to be appointed at a late stage so that there would be enough signatures on the report before it was submitted to the president

After all, we are about to complete 50 years of independence, and with the passing of generations, such a re-examination is often necessary of even things that we consider familiar. It is in that spirit that this matter is being raised for debate.

On a matter that affects the states so vitally as the awards of the Finance Commissions, should not the states have a say in the selection of the members of the Finance Commission? There are different ways in which this can be done. Each of these ways will add to the federal nature of our polity in an essential

way. A few 'models' can be suggested. \* The president, in addition to the prime minister and the finance minister, could also consult the governors of the states in this matter. Based on the input received, he could then take an appropriate decision within the ambit of the 1951 Act, and order the constitution of the Finance Commission. \* If an Inter-State Council under Article 263 has been constituted, the president could seek its advice in this matter. Such a council would reflect the needs and requirements of both the union and the states, and it would also reflect the relative balance prevailing at any given time. It would reflect a view on emerging priorities that should be useful. If the council has been fairly constituted, and if it has its own institutional experties, such advice should prove to be valuable to the president in the discharge of his duties.

\* The president may choose to request the concerned professional bodies to present him with a panel of names of people who meet at least the minimum criteria mentioned in the Act (and perhaps more that the president may choose to add) from which he could choose the members. The chief justice of India could suggest a suitable judge, the Indian economic association may suggest a suitable economist. And so on.

There could be other ways of consultation by the president. No fetters need be placed on the discretion of the president in the way he chooses to consult the various parties involved.

The point is that the president need not be bound in this matter by the advice of the union council of ministers, who represent only the union government's point of view. As head of state, the president represents the entire country, not just the union of India. He has to take the concerns of the states into account formally. Article 74 places constraints on him in union matters. Under Article 280, he need not be so trammelled. It can be argued that in this matter, the president must not act under Article 74, but under Article 280. One article is not subordinate to another.

An Inter-State Council was set up by the then president on the advice of the VP Singh government. Instead, it could have been constituted by the president exercising his inherent powers under Article 263, and not under advice from the council of ministers under Article 74. Each article of the Constitution has equal weight. Yes, they must be read as a whole Article 74 only refers to the items under the direct responsibility of the union government under List 1 of the Seventh Schedule. On these matters, the union cabinet has a clear role in advising the president. But the president is head of state. He is the first citizen of India as a union of states, not head of the union government. which is the prime minister. The president is free to consult anyone, including the cabinet, but in exercising these powers, he is a free agent under the Constitution. Forgetting this important point has been one of the unfortunate errors of the past several years. In fact, the amendments to Article 74 in the 42nd Amendment to the Constitution, were not undone by the 44th amendment. There may be political explanations for this. But it does not mean the president is bound by advice on matters outside the ambit of Article 74. That was never the case. By the same token, the prime minister too does not have unlimited jurisdiction. His concern is the union government. This matter needs to be openly, and seriously, debated. Consider Article 53, cited below in part:

Executive Power of the Union – (1) The executive power of the union shall be vested in the president and shall be exercised by him either directly or through officers subordinate to him in accordance with this Constitution.

Article 53 clearly envisages a situation in which the president acts directly. Then he is not bound in all matters by Article 74. Further, let us consider Article 78, reproduced below:

Duties of prime minister as respects the furnishing of information to the president, etc, — it shall be the duty of the prime minister—(a) to communicate to the president all decisions of the council of ministers relating to the administration of the affairs of the union and proposals for legislation; (b) to furnish such information relating to the administration of the affairs of the union and proposals for legislation as the president may call for; and (c) if the president so requires, to submit for the consideration of the council of ministers any matter on which a decision has been taken by a minister but which has not been considered in the council.

Very clearly, this limits the prime minister to the affairs of the union. And the affairs of the union are defined in Article 246, and the lists in the Seventh Schedule. For parliament these are List 1 and List 111, on union and concurrent matters. There are 97 items in List 1, but this does not include the Finance Commission. Of the 47 entries in List 111, item 20 on economic and Social planning may be considered womewhat relevant to the question of Finance Commission. This would then require consultation with the states.

It can be argued that a matter not specifically mentioned comes under the union. That is true. But the Finance Commission is covered by an Article of the Constitution. It can hardly be considered an item not mentioned. Thus, the case for a procedure of setting up the commission involving consultation with the states would appear to be, at least, desirable, if not necessary.

Is this really very radical?

Parliament recently passed the 73rd and 74th Amendments which require that the states also appoint Finance Commissions to deal with the question of devolution of finances to local governments. Such an issue cannot be left solely in the hands of a state government, There is no reason to believe that the state governments will on their own

willingly devolve finances and powers to lower tiers of local government. This is because the state government is an interested party. Under Article 243-I, the governor of each state has to constitute State Finance Commissions. This, together with Article 243-Y, deals with these matters at the local government level. How has this been practised in the various states? Do the arguments above apply in principle also to

the states? If yes, how should zilla panchayats and nagarpalikas be consulted? Should interdistrict councils be set up? Each state will have to ponder on such issues at its own level and come up with institutional innovations. There may be many ways of dealing with these questions. We cannot expect unique answers. These constitutional amendments have forced such rethinking upon us. The challenge is tremendous.

### Childhood in Rajgarh

### Too Young for Wedlock, Too Old for the Cradle

Rajeshwari Chandrasekar

Till recently child marriages flourished in the backward district of Rajgarh in western Madhya Pradesh. But a concerted campaign against child marriages by the district administration for past three years has resulted in averting 90 per cent of engagements from culminating into child marriages.

RAJGARH district in western Madhya Pradesh is a typically backward district with poor resources and people. The district comprises of six blocks with a total population of 9,92,764 as in 1991. The district is situated just 150 kms from Bhopal, the capital of MP and 250 kms from Indore, the district with the highest human development index (HDI) in MP. It lies on the Bombay-Agra national highway and is well connected to the main islands of development. In spite of having locational advantages, Rajgarh is on the hinterland of development. Much remains to be done in terms of its human development. According to the MP human development report 1995, the district ranks 43rd among 45 in the state. Even among the seven districts of the Bhopal division, Ragarh ranks last. This is an obvious inference to its relatively poor levels of human development.

Rajgarh is commonly known for its 3 N's, ie, 'naru', 'nukta' and 'natra'. While the first is a typically health problem, the latter two are entirely social issues. Naru is guineaworm in the local parlance; the district used to be endemic to guineaworm incidence. Today, due to efforts of the district administration, the problem has been eradicated completely. However, the other two problems continue and are deeply embedded in the society.

Among many other reasons for Rajgarh's low human investment is its caste-ridden society with distinct vertical and horizontal hierarchies. These boundaries affect the entire social fabric of the district. One of the busic tenets of this casteism is the system of early marriages. For times immemorial, young children were bonded to each other's families in marriage alliances. Another disquicting feature is the practice of the sale of the women to other men in return for a handsome price. The natra, as it is locally called, is closely linked to the child marriage issue.

For unless a boy is committed to early marriage, he cannot indulge in natra. Thus, child marriages is a passport to natra. Natra is a status symbol; a macho symbol.

Nukta is connected with rituals after the death of a person while natra is the ritual done to a woman during her lifetime itself! Women are accorded secondary status in society; there is nothing peculiar to Rajgarh alone. But what makes the difference is the ritual of selling the woman many times over to the highest bidder in order to prove machismo. The largest beneficiary is the father of the girl who uses her to gain a neat sum. Men are prepared to pawn their goats, cows and buffaloes and in well-to-do households, even gold and silver to get a woman. In all these transactions the woman

TABLE 1. INCIDENCE OF ENGAGEMENTS BY MAJOR CASTES

is never in the picture - she accepts the deal as part of her womanhood!

Closely connected to the issue of sale and resale of women is the century-old custom of child marriage. Rajgarh occupies a unique position in the map of MP because of its proximity to the bordering state of Rajasthan. In fact all the three N's mentioned above are not originated in Rajgarh itself. The influence of the bordering state is conspicuously visible for there is a constant migration of population from and to Rajgarh from across the border. Indeed the habits and (mis)deeds of the border state have a telling effect on the district. Child marriage is no exception.

The custom of early marriages is deeply entrenched in the society. It is an age old custom which has been carried forward to generations from times immemorial. These marriages are not round the year. There is an auspicious time in the almanac when it is considered good to perform the marriages. This date is locally known as 'akshaya tritiya'. Ironically it coincides with the agricultural season of harvesting when the major crop is cut on its maturity. The children too are considered mature enough to enter wedlock on this holy day! According to the local custom, every moment in the day is considered auspicious enough to get married.

#### POSITIVI INTERVENTIONS

The last three years have witnessed an annual campaign by the district administration around the time of the akshaya tritiya. The last year's campaign was with a difference. Caste based sammelans were organised along with the women's groups who had recently been freed from the bondage of illiteracy. These samaj sammelans and the mahila sammelans added a lot of difference to the routine campaign. Their appeal made better impact on the masses in terms of delaying the marriages.

How old are the children? Are they from all castes and classes? Are they everywhere in the district and in the panchayats? What has been the impact of the campaign against child marriage? These were the questions that come to everybody's mind. An evaluation of the campaign of such a sensitive issue is indeed difficult. Nobody likes to hear advice on stopping or delaying marriages. More so when it comes to actual collection of data. But it was becoming increasingly imperative to assess the progress and the qualitative impact on the families, it any.

TABLE 2: GENDER GAP IN ENGAGEMENT

| Mean Age of          | Mean Age at Engagement (Girls)* |         |        |          |            |       |  |  |
|----------------------|---------------------------------|---------|--------|----------|------------|-------|--|--|
| Engagement (Boys)    | Khilchipur                      | Rajgarh | Biaora | Jeerapur | Narsingpur | Total |  |  |
| Less than five years | 1.27                            | 2 26    | 4.44   | 1.27     | 2.14       | 20    |  |  |
| 5.01-10.00           | 5.94                            | 5.84    | 7.00   | 4.84     | 5 89       | 5 90  |  |  |

<sup>\*</sup> Data for Sarangpur not available.

It was therefore decided to develop a data base on the child marriage scenario in a time frame and social background. A set of questionnaires was printed and information sought from all the households in all villages of the district on the age and sex distribution of children to enter to wedlock. This data base sets the benchmark for all future comparisons and analysis. (It must be remembered that since this was the first time that a format was prepared, there were certain limitations on the data. These will be taken into account in the next year's survey.)

The average age of engagement of girls in the district is seven years and for boys nine years. Between the blocks, Khilchipur and Jeerapur record the lowest average for boys (8.1) and girls (6.4) years respectively. Narsingpur with an average of 10 and 8 years for boys and girls respectively is the maximum age limit for engagement.

While the age of engagement is low, what makes it worse is that they were conducted two-three years ago. It is surprising that even toddlers (of one-two years) have tied the marital knot. These children remain in the parental home till they come of age and then join the marital home.

Are these marriages predominant in all castes? Is it an annual practice? No. For data reveals that there are certain castes in the districts where majority of child marriages take place. These are chamar, dangi, sondhwadi, dhakkad and loda. An analysis of last year's child marriage/engagements shows that chamar topped the list (183) with dangi (150). Among the four major castes where these occurrences take place, this pattern was visible in all blocks. In Sarangpur, mali castes ranked first with 93 engagements while Biora and Khilchipur were ranked first for dangri samaj. The chamars in Narsingpur and the sondhwadis in Jeerapur and Rajgarh blocks were the foremost in the list.

The child marriages are an annual feature – however, there has been a sharp decline in the last year in terms of number of castes involved in child engagements and its quantum In Narsingpur, most of the castes (98.5 per cent) who had been in practice since long continued it in 1995. It was only in Khilchipur that the incidence was lowest (22.2 per cent) as compared to last five years. This in itself is an improvement as it indicates a movement towards iesser number of castes and lower incidence thereby.

One would naturally expect that with this number of child engagements, marriages would also be conducted in equal numbers. In Rajgarh, thanks to the mounting of the literacy campaign with anti-child marriage, engagements were not fructified into marriages. Less than 10 per cent of panchayats witnessed child marriages. In 90 per cent of them, child marriages were averted because of social pressures. However, in Sarangpur block, the proportion of marriages averted is comparatively lower than in the rest of the district.

A trend analysis over five years indicate that while the peak was attained in 1990s and a plateau had been maintained till 1994, there has been a sudden decline in 1995 indicating the impact of the campaign. To elaborate, in Dangi caste, while 297 engagements were held five years ago, the number steadily declined to 168 in 1992 and finally dropped to 80 in 1995. This was true in all blocks of the district.

In about 15 per cent of castes, the average age of engagement of girls is within six years of age. The proportion more than doubles (44.2 per cent) for the next age group, i e, six-nine years. About 60 per cent of girls are engaged by age of nine years. No girl remains to be engaged after 15 years of age.

The picture is dramatically reversed in the case of boys. Less than 30 per cent of boys below nine years are engaged while their proportion is more (63 per cent) among those aged 9-15 years. Thus, early engagement syndrome affects a girl more than a boy. The matrix for boys' versus girls' age at engagement shows that there is not much gender gap (Table 2).

However, if the present age of boys and girls is compared with their mean age at engagement, it is found while 48 per cent of girls under 10 were already engaged, the proportion is lower (43 per cent) in case of boys for the same age group. Similarly, while over 41 per cent of girls above 11 years are engaged, nearly 58 per cent of boys are in this age group. Thus, childgrooms do exist but they are relatively older. The brides are numerically stronger in the younger age groups.

The above analysis shows the condition of the children in Rajgarh district. These children, especially the girls, are robbed of their childhood at an early age. The humdrum of preparing for their new life takes over and they fall into the same trap as did their forefathers. The boys play around and joke about their fiance while the girls hold their husbands in awe - for very soon their routine will begin of a new home, albeit temporarily and new relationships. Every akshaya tritiya will go down in the annals of history of Rajgarh as a day for the children to remember and rejoice. But at what cost this rejoicing?

**KARNATAKA** 

## Tribals on Warpath: Confronting Eco-Terrorism

Muzaffar Assadi

Tribals in the Nagarhole and H D Kote regions of Karnataka have been protesting against the eco-development programmes sponsored by the World Bank. These programmes will result in the large-scale displacement of tribal population and a complete destruction of their way of life.

WHEN the 'son of the soil' Deve Gowda, the prime minister was addressing the nation from the rampart of Red Fort, the "real sons of the soil" (tribals) in his home state had very little time to celebrate his success and listen to his speech. They had other immediate issues to attend to. On the day of national celebration they were demanding, in the Nagarhole National Park Area in Coorg district their 'freedom' and 'liberty' freedom from exploitation, freedom from evictions, freedom from rehabilitation, freedom from eco-tourism perpetrated by the Indian state and western capitalism/World Bank. This was particularly aimed at retaining their cultural identity and communitarian life on the one hand and confronting ecoterrorism on the other. However, the state did not treat the slogan shouting tribals in Nagarhole as anti-nationals, neither did the state arrest them for taking out a procession denouncing the celebration of 50th year of independence. The reasons are obvious: the Indian state has become weak in the context of post-liberalisation phase and arresting the tribals would legitimise their claims.

The tribals particularly Jenu Kurubas, Betta Kurubas, Soligas, Yeravas in the Nagarhole region of Coorg and H D Kote (in Mysore) in recent days have become the victims of eco-development programme sponsored by the World Bank. This has externalised the contradiction and that the contradiction has taken a class form. The tribals are becoming a 'displaced' category both from their land and from their culture. In addition they are now getting linked to western capitalism although their interaction with the larger market system is still minimal. They are not bound to anybody except in some coffee estates where they still work as bonded labourers. However, their struggle and the position is distinctively different from other exploited categories like dalits. The latter are the victims of caste oppression, mainly in the context of post-colonial present they have become the primary contradictions of the dominant castes. This has become a

possibility because of migration of upper castes from the rural areas to urban areas and the subsequent elimination of absentee landlord class belonging to the same upper caste has left the dalits under the hegemonic control of dominant castes. Finally the presence of dalits in every village as agricultural labourers also has sharpened caste conflicts in the rural areas.

On the other hand adivasis or tribal population in Karnataka is very small 4.5 percent to the total population (1991). Nearly 12 per cent of population is located in Nagarhole area which is constituted of four ranges in Coorg and three ranges in Mysore district (in the latter district it is called Kakanakote). Since the tribals are located in these areas the nature of exploitation and subsequently the contradiction that they face is different. Historically their immediate contradiction has been the state - colonial, princely state and the post-colonial Indian state (through the forest officials). In recent days the entry of World Bank under the garb of eco-development project has added one more dimension to the contradiction. This has come at a time when Indian state was giving up the model of 'common economy' succumbing to western capitalism. It is in this context that the adivasis of Karnataka in particular, India in general are faced with the task of confronting two/dual contradictions simultaneously. Here the problem that the tribals are confronting is that of according primacy to contradictions - either the Indian state or the western capitalism/World Bank. Since the Indian state has succumbed to western capitalism via the World Bank and that since there are no differences in the approaches of both the Indian state and western capitalism vis-a-vis the tribals, both constitute primary contradictions. Therefore the ongoing struggles of tribals has become a part of the larger struggle both against the Indian state and western capitalism.

Tribals in the Nagarhole areas have been the victims of appropriation all these years. During the colonial period the princely State of Mysore and the colonial powers exploited the forest for the purpose of constructing/ building ships and laving railway tracks. They were exploited for forest knowledge, forest products and flora and fauna. This tendency continued even during the postcolonial period except that after the enactment of Wild Life Protection Act of 1972 the tendency of treating tribals changed, which however, had larger consequences on tribals. After 1972 the forest was exploited for the purpose of distant markets and for the urban oriented consumers, mainly supporting the cause of paper and pulp industries. Even forest area was systematically destroyed to make way for dams, which also had the consequences of displacing the tribals without providing any alternatives to them. For example, when a dam across Kabini river was constructed not only did 17 tribal

'hadies' (villages) submerged in it but also till date, they have not been properly rehabilitated. All these years nearly 200 tribal families have been forcibly driven out of forest. As an alternative for leaving their houses the hadies tribals are given either the barren or unfertile land. This kind of lands have no meanings for the tribals. Even the forest officials, representing the Indian state, would not allow the tribals to grow any crops. Most of the time their lands were forcibly converted into monoculture farms - basically teak wood farms. To force the tribals to leave the forests, forest officials would resort to different kinds of tactics: they would let loose elephants for destroying the property of the tribals, digging huge trenches on the roads thereby preventing movement of tribals; levelling false charges of killing animals (like deers, peacocks, etc); abusing sexually the tribal women; denying permission to repair their dwellings, obstructing the implementation of government sponsored programmes, charging the tribals whenever they were found collecting firewood, honey, grass, bamboos for their domestic needs.

All these years tribals adopted different forms of protest against appropriation and exploitation: dharnas, protest marches, defying the law, submitting memoranda and sometimes face to face confrontation (except for Dhoondiya Wagh's revolt of 1857 Karnataka does not have a history of tribal revolts). Their struggle now has shaped into a movement. Even NGOs are extending their support to their cause except that when they descended down to Mysore on August 23, 1996 to 'speak to urbanites' there was hardly any response from the urbanites. Meanwhile tribals have formed many organisations: Rajya Moolanivasi Budakattu Janara Vedike in Hunsur, Girijanara Jilla Samiti in H D Kote, Nagarhole Budakattu Janara Hakku Sthapana Samiti in Coorg, Budakkattu Krashikara Sangha in Nagarhole, and Karnataka Rajya Moolanivasi Budakattu Janara Vedike.

Nevertheless the tribal protest in Nagarhole region is not that unusual. Tribals protested when the forest officials blamed them for the death of a radio-collored cheetah ('kallala') and also when their standing crops were destroyed (in Nanachi). Tribals also opposed digging the trenches thereby preventing them from entering their paddy fields and hadies (in Shrenihadlu, Karekundi, Madenoor, etc). They also opposed "when an ill motivated ranger put unfounded blames on tribal people, beat them, lodged complaints on them for thieving of sandalwood trees in the forest by outsiders" (in Thithimathi) and also opposed their harassment when they go into the forest for collecting firewood and other minor forest produce (in Madenoor). In some places tribals opposed the molestation of their women folk (in Chikkareshme, Antharasanthe) and protested "when forest department staff started to clear-cut wood and make charcoais (Chottepare). Two important struggles in recent days have received attention. The first instance related to the "enter the forest" struggle in 1995 during which tribals not only entered the forest but also established their 'rule'. In the second instance, in June 1996, tribals opposed the destruction of standing ragi and cotton crops in 11 acres in Dadadhalli in HD Kote. Earlier Dadadhalli made news for the starvation death of 10 tribal children.

The most important issue which tribals of Nagarhole area are concerned about is the conversion of Nagarhole forest area into National Park and the subsequent World Bank plan. The logic behind introducing eco-development in this particular forest is quite perplexing:

India's bio-diversity is rich, often unique and increasingly endangered. India is of the 12 megadiversity countries in the world, that collectively account for 60-70 per cent of world's biodiversity. Its ten biogeographic zones represent a broad range of ecosystem. India's biological resources are economically. important both globally and nationally. Many species of crop plants found worldwide and their wild relatives originate on the subcontinent ... The biodiversity in India's forests, grasslands, wetland and marine ecosystems faces many pressures. These include grazing cattle, cutting of trees for fuel, timber, and non-timber forest products, hunting, uncontrolled fires and conversion spillover from agricultural, infrastructure, industrial and commercial development. India's high levels of human population density and growth, high incidence of poverty and large numbers of livestock speed the degradation. Local people, when traditional rights and access are limited by the establishment of Protected Areas, often have little incentive to use natural resources in a sustainable way. (India, Eco-development Project: Project Information Document, March 22, 1996, pp 1-2.)

This is a 70 million dollar project covering seven protected areas (PA), in seven states of India - Bihar, Gujarat, Karnataka, Madhya Pradesh, Rajasthan and West Bengal - and covers five tiger reserves (Buxa Tiger Reserve in West Bengal, Palamau Tiger Reserve in Bihar, Pench Tiger Reserve in Madhya Pradesh, Periyar Tiger Reserve in Kerala, Ranthambore Tiger Reserve in Rajasthan), one Asiatic lion reserve (Gir National Park in Gujarat) and one elephant reserve (Nagarhole National Park in Karnataka). In total the project would cover 6.714 sq km of protected areas with a tribal population of 48,800. Interestingly the World Bank report has not shown any tribal population living in the core areas of Nagarhole National Park. This naturally raises the guestion as to why the World Bank report is insisting on the rehabilitation of tribals from the 'core areas'. This is one of the paradoxes of the project.

The Eco-Development Project has been designed to target the "tribal people, and

torest tringe vittagers belong to the poorest sections of society". In this particular project, "the tribal development concerns are addressed in an integral fashion under the rubric of social impact participation and equity, rather than as a subsidiary tribal development plan or component". Project also "incorporates specific measures to safeguard the interests of the landless and women, through participation in village committees, employment preference and ongoing social assessment review and other monitoring". Nevertheless it has identified five core areas as its main objectives: to improve the capacity of PA management to conserve biodiversity and to increase opportunities for local participation in PA management activities and decisions; reduce negative impact of PAs on local people and increase collaboration of local people in conservation efforts; more effective and extensive support for PA eco-development to ensure effective management and finally prepare biodiversity to ensure effective management and finally prepare biodiversity project. However, the dangerous aspect in the eco-development project is the 'pragmatic approach', which ultimately seeks to develop "voluntary reallocation opportunities for people" especially on the basis of "wishes of local people". Since the concept 'local people' is used ambiguously anybody can misappropriate it and make the life of tribals a miserable one. Although it is said in the réport that "reallocation would be to lands on the periphery of PAs, rather than distant, non-forest lands", there is no guarantee that this particular aspect would be followed or observed. Even displacement will have multiple consequences: creates conditions for cultural crises, cultural oppression, and crisis of autonomy.

The second important danger is that the project can be located in the reciprocal commitment. This involves, "mutual guid pro quo of investments that foster alternative livelihoods and resource uses and specific measurable actions by local people to improve conservation." In the former case it has identified biomass substitution", biomass generation and forestry, ecotourism, agriculture including watershed management, small irrigation and livestock, agro-processing and artisanry. There is danger that investment on biomass generation might imbalance the ecology of forest especially when new varieties of plants/trees are planted in the place of traditional one. This is the one way to bring back 'social forestry' to the centre stage, which has earlier caused irreparable damages to the rural economy of Karnataka. Nagarhole region is also becoming a prey to 'social forestry'. These days teak plantations are coming up in the midst of National Park area, which, however, have no meanings for tribals except that they link the forest with the larger market.

Nevertheless the stress on "managing enterprise and visitor enclaves" has opened tourism' in the forest area. This has provided scope for the big industrialists to operate their star hotels in the midst of forests thereby causing much damages to tribal culture and society. In fact, when the government leased out the Moorkal Jungle Resort located inside the National Park in Nagarhole to Taj group for Rs 1.25 lakh per annum recently, the tribals resisted. (Presently they are adopting new method of planting traditional saplings and writing graffiti on the walls). This will ultimately converge into eco-terrorism as its consequences are multiple: increases the alienation between tribals and the forest, superimposing non-tribal culture on tribals, linking tribal society with consumerist western society, destruction of the ecology of forest, unemployment increase and finally this will provide spaces for western capitalism/capitalist to appropriate our forests both for genetic resources and for entertainment.

Finally the project paper says that the project (See, The World Bank in Nagarhole: A Story of Human Rights Violation Lies and Deceit) would be "owned by Indians". However, question can be raised as to who would "really own" it - the government, the tribals or the masses? Since the World Bank report has overlooked the existence of tribals in the core area, one can rule out the possibility of project being handed over to tribals. This is the reason why the World Bank and the government of India have neither invited nor involved the tribals of Nagarhole during the negotiations of the project. Every deal is being kept under cover. Nor have the texts been translated into local languages.

The tribals are also demanding the implementation of Bhuria Committee report. which would consequently help them retain and reclaim their communitarian life and autonomy. Other demands include uniform law for the protection of forest areas, declaring natural resources the common property of tribals, providing facilities like walkie talkies, telephones, transport, changing the nomenclature of forest department, bringing to a halt the construction of dams and roads inside the forest areas, total rights over forest produce, providing basic facilities like hospitals, dispensary, water and schools.

The task that the Bhuria Committee confronted was reconciling the traditional social structures with that of the modern political institutions like panchayati raj. And thereby avoiding any conflict between 'tradition' and 'modernity'. This is because of the fact to at for tribals community is the basic unit and life is an organic whole and that, superimposing any new institutions would become detrimental to their existence. To retain the autonomy and the identity of the tribals on the one hand, and to draw the tribals to the different institutions of democracy the Bhuria Committee made series of suggestions.

up a new enterprise system called "Beo." The Bhuria Committee; which submitted its report on January 17, 1995 recommended a four-tier system, although there are spaces for the three-tier system to operate. At the grass root level committee accepted "community rather than the administrative unit like village as the basic unit of the selfgovernance in tribal area". The community here is identified with body of all those who are on the voters list. This obviously raises the doubts about its application to the core area. However, grass-root body is designated as gram sabha, whose task will be managing the affairs in accordance with well established customs and traditions. Nonetheless the committee has recognised 29 functions which include safeguarding and managing the rights of tribals. These are suggested keeping in mind the tribals who are living in the periphery or outskirts of forests rather than the core area. Next in line are gram panchavats constituted by many hamlets or villages. Since it is based on an elective system, it reflects the modern panchayats both in terms of power and responsibilities. However, what distinguishes its powers from other ordinary panchayats is the power to rehabilitate the displaced and preparing a development plan for five years. In fact we have a huge backlog of 1,15,00,000 persons (in 1989) who are vet to be rehabilitated.

The third tier in the tribal area is the intermediate panchayats, variously called panchayati sabha, janapadha sabha, tajuk panchayats, and its functions/duties are coterminous with development block. However, the last and the final tier, district council will not be suitable to Nagarhole in particular, Karnataka in general as there is no such scheduled areas in Karnataka, Unless scheduled areas are declared and brought under fifth schedule the district council that the committee has recommended will have marginal meanings. In addition there is a practical problem. Carving out a district exclusively for the tribals might invite troubles from other corners, especially it will clash with the demand for a separate statehood made by the organisation called Liberation Warriors of Koorg (LIWAKS) in Coorg. The latter's demand emanated from the fact that Coorg is one of the richest districts (mainly coffee growing district) in terms of its contribution to GDP of the state on the one hand, and the least developed districts on the other (there are least number of schools/colleges, hospitals, industrial units and roads). In addition the intrusion of Malayalees, as enterpreneurial class has not only deprived the local population of their employment but also their hold over economy. This has given place for the rightist elements to grow in this district which sometimes translated into communal conflict also. Therefore the task of implementing the Bhuria Committee report in Nagarhole region will face rough weather. Will the Indian state allow the tribals to retain their identity? Will the 'real son(s) of the soil' stand up?

### Land Reforms to Fight Hunger

### **Bharat Dogra**

Although there is increasing evidence that a more equitable distribution of farmland actually leads to better productivity, third world countries, including India, have been reluctant to implement rigorous land reforms.

IT is widely agreed that increasing land availability to the poorest peasants and reducing inequalities in the distribution of agricultural land are highly desirable for reducing hunger and malnutrition in the world. Despite this, inequalities in the distribution of agricultural land remain at high levels in many countries probably reaching the peak in some Latin American countries.

Inequality is often expressed by a statistical measure called the gini coefficient, which varies from zero (equal assets for everybody) to one (one person owns everything). In most Latin American countries, the gini coefficient for land distribution is around 0.8, in Panama it is 0.84, in Brazil 0.86 and in Paraguay 0.94. The inequalities in the distribution of agricultural land may be most acute in Latin America, but it also exists to a significant extent in many other countries of the world. In Egypt the richest 20 per cent of landowners control 70 per cent of the agricultural land. In Bangladesh farmers owning less then 2.5 acres constitute 70 per cent of all farmers of this country, but they together have only 20 per cent of the land area.

The situation is somewhat similar in India. The Seventh Plan document (1985) of India says, "Small and marginal farmers with holdings of land up to two hectares represent about 73 per cent of the land holdings but are cultivating only about 23 per cent of the cropped area". The land ownership scene in various parts of the world has been summarised by the FAO in its widely quoted publication titled Agriculture toward 2000.

The proportion of landless in the agricultural working population is highest, and increasing, in Latin America and Asia. Latin America exhibits the greatest inequality in land distribution, whereas in the Far East and the Near East this inequality is somewhat less marked, although still substantial. In most parts of Africa, where customary tenure is still predominant, arable or pasture lands belong to the community, while the crops or livestock reared on them are privately owned. However, where the current trend is toward more land coming under private ownership or control, inequality and landlessness are generally increasing.

FAO has also stressed that more equal land distribution is likely to increase productivity of land.

It is important to stress here that yields per hectare are as high on small as on large farms or, under traditional agriculture, even higher. With a few notable exceptions, total output per hectare is higher on small farms, chiefly because their intensity of land use is higher. A more equal distribution of production inputs, including services, can only help to strengthen the role of the small farm in expanding production. The fact that some attempts at radical redistribution of land have led initially to lower production does not invalidate the conclusion that after some years a more even distribution of farming resources and inputs should help rather than hinder growth of output.

This view of FAO is supported by a sixcountry study by the International Labour Organisation (ILO) which estimated that

If land were equally distributed among all agricultural families (including the landless), and the new equal holdings achieved yields equal to present holdings of the same size and used a similal level of inputs, food output could potentially rise by anything from 10 per cent (Pakistan) and 28 per cent (Colombo and a rice-growing Malaysian region) to 80 per cent in northeastern Brazil. Such a radical redistribution is, of course, rarely attempted – but the figures indicate the theoretical potential.

While calculating this potential of increasing productivity FAO notes that the meaning of small and large land holdings is quite different in different parts of the world.

In Latin America, a "small holding" is taken to be less than 10 hectares, in the Near East less than five hectares and in Africa and the Far East, no more than two hectares. Similarly, the indicative ceilings beyond which a farm may be considered to be a "large holding" vary from 100 hectares in Latin America through 20 hectares in the Near East to 10 hectares in Africa and the Far East

The potential of land redistribution in each region is shown by the FAO in Table. Summarising this table, FAO says,

According to the information [in the table], and assuming that the indicative ceilings as defined above were enforced, redistributing

the area potentially available, even in the densely populated Far East, could improve the lot of small holders and landless very significantly. In the majority of countries, at least 10 per cent of farm area would be redistributed (in some countries the share would be significantly larger) and the benefits of doing so as a primary approach to improved distribution in agriculture would be considerable. However, since national situations vary considerably, land redistribution cannot be taken as a panacea applicable everywhere. Redistribution of only 5 per cent of farmland in India, coupled with improved access to water, could reduce rural poverty levels by 30 per cent under what they would otherwise he, so that in Indian conditions land and water reform would be a key approach. The impact of land redistribution would, on the other hand, be limited in overcrowded areas such as Bangladesh, because the area of land available for redistribution is very small and population growth high.

The view of the FAO that greater equality in farmland distribution will increase productivity is also supported by a World Bank publication The Assault on World Poverty - Problems of Rural Development, Education and Health. This study notes that:

- In Thailand plots of two to four acres produce almost 60 per cent more rice per acre than farms of 140 acres or more.
- An analysis of the differences in the value of output on large and small farms in Argentina, Brazil, Chile, Colombia, Ecuador and Guatemala revealed that small farms were three to 14 times more productive per acre than the large farms.

Frances Lappe and Joseph Collins examined the data of net income per acre by farm size in the US from 1960 to 1973. In 12 out of 14 years the net income per acre was greater on the (smaller) tamily farms. Therefore the evidence in favour of small farms and for having a more equal distribution of agricultural land is quite strong. It is another matter that as vested interests opposing redistribution are quite strong, the land reform effort can face several obstacles due to which there can be temporary setbacks. But if a broad support base for land redistribution is used carefully and with a lot of planning and foresight, it should be possible to overcome these obstacles and carry out by and large peaceful programmes of redistribution of agricultural land which increase the productivity significantly while also improving the livelihood of the poorest

Table: Potential Area of Farmland Redistribution (Around 1970)

|                                                                                                                 | Latın<br>America | Africa | Near<br>East | Far<br>East |

## From New to Human Order in Indonesia?

Olle Tornquist

The significance of the July 27 events is not that they mark the beginning of the end of Suharto's New Order, but that they signal the devastating ways in which political transition in the country may come about.

ON June 20 a government-sponsored faction of the officially recognised Indonesian Democratic Party (PDI) met in Medan, North Sumatra, to do away with its legally elected leader Megawati Sukarnoputri. Around the country, however, Megawati and her increasingly many supporters refused to give up. In Jakarta they held on to the party headquarters on Jalan Diponogoro. The situation became increasingly tense. At about 6 o'clock in the morning on July 27, policemen and soldiers stood by in the streets nearby the PDI office as several yellow painted army-like troop transport trucks drew up in front of the building and unloaded hordes of young, muscular men with shortcropped hair wearing caps and red T-shirts saying they were supporters of the government-sponsored faction. The redshirts attacked with rocks, tear gas, and acid. There was panic inside the house and some tried to get out but many stood up and responded by throwing rocks. The police did nothing to put an end to the attack but instead harshly prevented upset people who gathered in the streets from doing so. Negotiations followed but broke down as the police finally even helped the thugs to advance. Hence the red-shirts could charge the office and chase the PDI members inside, after which the police entered and took away the Megawati supporters, including many seriously injured and several possibly dead. However, more and more concerned people came to the area. Megawati's representatives tried new negotiations. These failed and the police violently attacked the masses, arresting and injuring bystanders as well. People had to flee in various directions, primarily towards Jl Matraman and Salemba Raya, where devastating riots followed. New demonstrations on Sunday were confronted with brutal police and military force.

Only on Monday was there some (distorted) news in the papers. Thereafter, however, the military stated they would shoot troublemakers 'on the spot'. And Suharto, soon accompanied by his loyalists, invented a scapegoat to prevent the pro-democracy forces from uniting and capitalising on the crackdown. All the trouble, it was stated, had been instigated by the young prodemocracy activists of the new small Peoples Democratic Party (PRD) who were labelled

communists. And what was more, these 'subversive elements' in turn had been 'masterminded' by all the other prodemocrats. Thus, the witch-hunt was on, no matter if even the US government, for the first time that I am aware of, expressed serious concern over the treatment of so-called communists.

And the hunt goes on. If somebody manages to hide, the authorities pick at the parents or wife/husband and even children instead. Hundreds are arrested, including independent trade union leader Muchtar Pakpahan. Many more are intimidated. For instance, even the official human rights commission has been told to keep 'national interests' in mind when reporting on its findings; independent human rights monitors, like Bambang Widjajanto, head of the Legal Aid Institute, have been summoned for questioning by the police; and as I am writing this on September I, an incoming e-mail says that the authorities have also summoned Gunawan Mohamad. editor of Tempo (the country's most reputed liberal weekly that was closed down in 1994) and currently chairman of the independent clectoral monitoring committee (KIPP).

To my understanding the significance of the July 27 affair is not that it does mark the beginning of the end of Suharto's New Order, but that it signals the devastating ways in which succession may come about.

Before leaving for Indonesia in early July, I had concluded a tentative version of a long essay on problems of democratisation in the country, primarily based on interviews in late 1994. By now, however, I realise that while my conclusions on the outright prodemocracy movement fared well, the more basic ones on what kind of transition is plausible were too optimistic.

My valid argument was that while the pro-democracy movement is potentially significant, the character and dynamics of the different groups point in the direction of divisive politicisation — which in itself does not generate an opening, in spite of devoted work and good intentions. Hence, I predicted, it is more likely that 'external' rallying points will give rise to a more general movement for transition from authoritarian rule. And within this broader movement many of the outright democrats will relate

to legally accepted populist democrats while others hold on to fragmented activism and development work, or insist on rather isolated top-down party building. Once the government tried to get rid of Megawati this, thus, proved true (aside from the fact that PRD actually acted in a less sectarian way than expected and also threw its lot behind Megawati). More and more people came out in support of Megawati, including the many workers who went on strike for better conditions. Even well placed government loyalists complained about their wives supporting the courageous woman who stood up against the old ruler. And taxi drivers taking me via Jl Diponogoro carefully slowed down outside the peaceful free speech forum at the PDI office compound offering themselves to carry along posters or flyers.

My second argument, however, must be revised. It is still true that a growing inability to regulate conflicts both within the elite and in its relation to new social forces (primarily the middle and working classes) makes transition from the old authoritarian rule inevitable - and that much of the additional factors which elsewhere nourished democratisation (including in the Philippines) are missing. But it is no longer possible to argue that the most likely scenario is orderly transition to a slightly more open and well regulated society through horse-trading among post-Suharto elites - an orderly transition which the outright democrats could take for granted and try to improve upon.

Actually this perspective began to fade away already as the government decided to block the attempts by the pro-Megawati people to mobilise people in the context of the 1997 elections, set up an electoral watch movement, and thus find a way of promoting democratisation by relating to the existing political system. It is true that the renewed populist blend of Sukarnoism and Muslim pluralism still calls for negotiated pacts with disenchanted factions among those in power. But those proved wrong who said that the government and the army were divided enough not only to allow Megawati to become leader of the PDI but also to tolerate that most outright pro-democrats would come along. It is also true that less pluralistic but reformist Muslims have realised that the clientelist government Golkar Party is a shell that is likely to vanish with its super patron Suharto and, therefore, still try to turn instead the pro-government Association of Muslim Intellectuals (ICMI) into a more genuine forum to modernise clintelism into Malyasian-like state-corporatism. But at no point from mid-June till July 27 am I aware of any sign that enlightened reformists, or slightly dissident officers, seriously tried and could have been able to accommodate the pro-democrats and to 'handle' them within a more open political framework. By now a leading ICMI reformist says instead that "this is a terrible setback for us as well ... there are dynamics within the army which we cannot do much about...[and] the old man doesn't listen and is getting paranoid". And when I ask how ICMI — which is not in favour of a transition based on multi-party negotiations and elections — shall accommodate other views and forces, such as those who rally behind Megawati and Gus Dur, Muslim pluralist Abdurrahman Wahid who is the leader of the world's largest Muslim organisation Nahdlatul Ulama, there is no other answer but "well, that's a good question".

So what happened on July 27 was 'only' that the regime displayed its total incapacity to reform itself, having instead to crack down on demonstrators and the prodemocracy movement in general with brutal force.

It is true that increasingly many reformists as well as business men now realise that this cannot go on, that clashes cost too much, that there must be more openness, a better regulated economy, and new institutions and organisations that allow for efficient and reliable negotiations among the elite as well as with the people at large. (It is better. for instance, to have a moderate union to deal with than to have 10,000 angry workers in the street who constantly have to be repressed by the army.) But what is the use of those insights if the reformists cannot start building the institutions and allowing the organisations until Suharto is gone? What can ICMI do, if its chairman technology minister Habibie always has to be on speaking terms with Suharto? Or what can enlightened military officers do, if the only way to sustain their positions is to be loyal to Suharto? Mean while the fundamental social and economic conflicts are getting worse

Some might add that sensible compromises and gradual democratisation are anyway inevitable because capitalism is flourishing and some kind of civil society has emerged. But a few individual liberties are not enough. It is fine if people like to have democracy. do not trust what is in the papers, and criticise the government in coffee-shop discussions. But to make a difference they must also be able to organise on the basis of common ideas and interests. And this they cannot. Indonesia today is way behind the Philippines 10 years ago, not to talk of South Africa five years ago. There is no mass organisation from below. The only option is incorporation of people into politics based on populism and what remains of the old pillars - Sukarnoism and Islam. And now July 27 displayed the risks in terms of poorly organised and angry masses that run wild and invite more repression. Moreover, the regime is rather successful in dividing the Muslims. Independent and pluralist Gus Dur is probably next on the list, if necessary.

However, July 27 also testifies to the fact that even the more genuine pro-democracy movements that aim at integrating rather than incorporating people into politics cannot make much difference. Their honest attempt to relate to the recognised political system by mobilising as many as possible in the context of the 1997 elections behind Megawati failed primarily because of the lack of space for more openness and gradual change. And then one must add that the basic weakness of the pro-democracy movement itself also proved to be a serious drawback - its fundamental separation between topdown activists who tend to run offside and grass roots activists who have not yet been able to generate interest-based mass organisations from below.

Hence I am afraid that the July 27 affair points in the direction of more unrest, more failures, and more crackdowns. Only when Suharto falls or steps down will the many actors who have remained loyal in order to survive try to handle transition. By then, therefore, the army remains the only solid organisation. But the generals can no longer run the country on their own. They must

look for support among businessmen and politicians – who are likely to compete with each other in offering different generals finance and mass support. And since most of the competing actors have not been able to prepare an institutional framework for a negotiated transition, they may not be able to settle their disputes in a smooth way either.

What can be done to alter this scenario? If the main points in this analysis are accepted, the only clear-cut path, even for businessmen with a strategic perspective, is the narrow one - that is to strengthen the position of the pro-democracy forces that do not depend on remaining loyal to the regime till the bitter end. And the only way of improving the independent position of these pro-democracy forces is to promote their attempts at bridging the gap between topdown activists and those working at the grass roots level. If various governments, agencies, and NGOs, especially those in the third world, develop at least a similarly enlightened understanding of these problems as have sections of the US administration, it should be possible to develop an urgent international movement in support of basic democratisation in Indonesia.

### CENTRE FOR SOCIAL STUDIES

Surat
TRAINING COURSE ON
COMPUTER APPLICATIONS IN SOCIAL SCIENCES

The Centre for Social Studies, Surat is organising an ICSSR sponsored course on *COMPUTER APPLICATIONS IN SOCIAL SCIENCES* from December 2 to December 11, 1996. The Course is meant for social science researchers who are engaged in survey research and need to deal with analysis and data processing. Knowledge to basic statistical method is essential. This course is designed to orient the participants to fundamentals of computer, computer processing, foundation of data processing, quantification methods, statistical techniques and use of SPSS.

Travel (to and fro second class), lodging and boarding will be provided free to the selected participants. Those selected will have to deposit Rs. 300/- as earnest money which is refundable only after full attendance in the course. Individuals should apply by furnishing the following information:

1. Name; la. Sex; 2. Address for communication with phone, fax etc; 3. Age; 4. Language (speak, read, write); 5. Affiliation to Institution/University; 6. Present position/designation; 7. Qualifications; 8. Discipline in which holding an M.Phil/Ph.D. degree with topic; 9. Survey research capability in terms of whether you have studied: (i) Survey research methods; (ii) Statistics; (iii) Data processing techniques; (iv) Computer packages/programmes (specify); 10. Computer language known (specify); 11. Accessibility to computer facility (detail); 12. List of your current research projects; 13. Whether travel expenses can be borne by your institute; 14. Have you applied to such courses conducted by us earlier?/ When? and 15. Recommendation of the supervisor or department head.

Completed applications to the Course Director, Centre for Social Studies, University Campus, Udhna-Magdalla Road, SURAT - 395 007 latest by 30th October, 1996.

Our Fax no. (0261) 667173/e-mail:sscss.ren.nic.in.

### This IMF Business

### Who Is Really Responsible?

S Akbar Zaidi

Reluctance to take unpleasant measures like strict tax collection, cut in defence expenditure, propels Pakistan to rush to the IMF to seek financial assistance.

THERE seems to be a great deal of euphoria across the country, and especially so amongst official and governmental circles, that the IMF has once again agreed to extend another standby loan worth US \$ 600 million to Pakistan. This latest agreement between the government of Pakistan and the IMF comes about after the cessation of the 1993-96 Extended Structural Adjustment Facility (ESAF) worth in excess of \$ 1 billion, halted around the time of the last budget in June 1995.

The Moeen Quraishi caretaker government in September 1993 signed a standby agreement with the IMF which became a precursor to the very large agreement signed by the Benazir Bhutto government. Things went rather well for the first two years of the programme where, while targets went unmet, the general direction and pace of the so-called 'reforms' seemed acceptable to the IMF. The tiscal deficit was brought down substantially, as were tariffs, but again, not as much as the IMF had wanted. The deregulation, liberalisation and privatisation agendas set by the IMF were also closely followed, and frequently re-negotiated when any hitch seemd to occur. Pakistan was cited as a good example of a country successfully following the IMF-devised structural adjustment programmes.

When the budget for the current fiscal year 1995-96 was announced in June of last year, it came as quite a pleasant surprise to all. Analysts, economists and business men were equally surprised by the fact that the government had, unexpectedly, offered a mild budget far removed from the strict budget that was widely anticipated. The tariff rate, for example, was cut, but by only 5 per cent, and not 20, as was expected, reducing the maximum tariff rate to 65 per cent. New taxes worth only Rs 16.3 million were announced, and the target for the budget deficit was set at 5 per cent of GDP, and not at 4.5 per cert as the IMF had insisted. All in all, the 1995-96 budget was perceived to be pro-industry and growth enhancing, with the belief that for a change, many of the targets would be met. Most of all, many analysts perceived the budget to represent the interests of Pakistan, rather than the demands set by the IMF.

The IMF was not at all pleased with this attempt by the government to show its independence, and the Fund froze the remaining tranche of the ESAF in its last year of operation. It took less than four months for the government to do U-turn, by imposing more taxes, devaluing the currency and promising the IMF that it would agree to its earlier conditions and begged the Fund to resume the aborted ESAF. Between October and December 1995, top officials of the government of Pakistan made numerous trips to Washington trying to appease the IMF and to convince them of the sincerity of their intentions in carrying out the rest of the programme. IMF officials also made visits to Islamabad and finally, towards the end of the last year, yet another agreement was signed.

The government immediately claimed victory and informed the public that the IMF by agreeing to the new loan, had endorsed the policies of the Benazir Bhutto government and had confirmed that the economy was doing well enough to warrant a loan from the Fund.

Over the last two or so years a great deal of analysis and research has been published in the press which has argued that the

conditionalities imposed on Pakistan by the IMF are harsh, and that implementing the programme will have serious negative consequences. Concern and opinions have been expressed amongst a large cross-section of analysts that by following IMP diktat in the form of the structural adjustment programmes, Pakistan's economy will get worse, not better. There are fears of inflation, caused by the government removing subsidies on a number of inputs and consumer items, and by the increase in administered prices for utilities, which are supposed to be brought in line with world prices. Many writers think that by reducing tariffs an increasing number of firms will be put out of business. The insistence that the fiscal deficit must be cut at all costs, is considered by many to result in lower expenditure on health and education, and more taxes on the already over-taxed urban consumers. While most of these themes have been elaborated upon in the press in this country, an important aspect to the discussion, why Pakistani governments run to the IMF in the first place, has not been adequately expressed or debated.

It is quite unfair to blame the IMF for any of the ills which plague Pakistan's economy. The IMF is justified in imposing any or all conditionalities when making a loan. It must ensure that the money is returned, and for that purpose, it must also ensure that the money that is lent is used for a purpose that the Fund believes will improve the economy so that the country is in a position to return the loans. Hence, to castigate the IMF for imposing 'harsh' conditionalities is futile, for the problem lies elsewhere.

It is our governments - past and present - which are responsible for the state of our economy. It is they who have signed

**APPOINTMENTS** 

### **CENTRE FOR SOCIAL STUDIES**

Surat

The Centre, social sciences research institute, invites applications from individuals holding a Doctorate degree in Sociology, Anthropology or interactive sciences and knowing Gujarati/Hindi and English to work as RESEARCH ASSOCIATES [Scaie: Rs. 2200-4000] on a project entitled, "Ethnographic Study on Malaria Control". Application with latest C.V. giving details of research interests and experiences should reach the Director, Centre for Social Studies, S. G. University Campus, Surat - 395 007 within 10 days.

agreements with the IMF accepting the latter's conditionality and promising to take many measures which are not always beneficial or popular. If a government is forced to go to the IMF, the Lender of Last Resorts, it is only because it has not been able, or has been unwilling, to take immediate and important steps itself. The way Pakistani governments have avoided taking such steps serves as a case in point.

Two critical concerns with our economy have centred around the fact that our resource mobilisation has been very low, and our expenditure has been excessively high. It is not the IMF which is responsible for either of these structural issues in our economy, but the inability of various governments to tackle these concerns. The taxation structure is wrought with numerous loopholes, exemptions, and rampant corruption, to ensure that a large part of the taxable income goes untaxed. Various vested interests act to preserve their interests by demanding and usually acquiring - exemptions in taxation. There is as yet no agricultural income tax in this country while 25 per cent of the GDP is contributed by the agricultural sector. Most influentials - agriculturalists and others - do not pay any tax at all. Only 1.5 million individuals out of a population of 130 million pay any income tax. Surely. many more than this 1 per cent of the population earn the minimum taxable Rs 4,000 per month. According to one estimate, more than three-quarters of potential tax payers do not pay taxes in Pakistan. Thus, the inability or unwillingness of the government to ensure an equitable, just, and extensive taxation structure ensures low resource mobilisation resulting in a high fiscal deficit with its numerous repercussions.

Another area where governments have chosen not to express concern is defence expenditure. With close to 6 per cent of our GDP being spent on defence, little remains for development. In fact, Pakistan must be one of the very few countries in the world where defence expenditure exceeds development expenditure each year. The political economy of our state does not permit the government to tackle the issue of military spending, but isn't it time it did?

Just these two examples from the economy highlight the fact that whatever mess Pakistan's economy finds itself in, is due not to the meddling and interference of the IMF—although that does exacerbate the problem—but is largely of our own doing. In order to ensure their extended survival, governments do not touch controversial areas and issues. Agricultural income tax and military spending are two such areas. Hence,

the reason why our governments rush to the IMF for financial assistance is that they continue to delay the day of reckoning. They acquire loans to meet their revenue gap so that they do not have to take unpleasant measures. In all this, if the people of Pakistan have a voice, it must be directed at criticising the wrong doings of our elected representatives, not the officials of an international bureaucracy. By blaming the IMF we are letting our governments off the book

It is our government which is responsible for the state of our economy and to us. It should be accountable to the people of this country. Popular pressure should be directed towards demanding reforms which would improve the structure of the economy so that there is no need to borrow under harsh conditionality. Whether it be agricultural income tax or land reforms, military spending or development expenditure, political parties and groups, intellectuals, NGOs and other pressure groups should force this government to undertake extensive reforms which are long over due. The responsibility about the state of the economy lies with our government, but equally with us, for it is we, the people of this country, who are responsible for our own destiny, and not the

Susan Wadley first visited Karimpur the village behind mud walls' made famous by William and Charlotte Wiser—as a graduate student in 1967. Since then, she has returned many times, adding her observations and experiences to the field

STRUGGLING WITH DESTINY IN KARIMPUR 1925-1984 SUSAN S WADLEY

notes compiled by the Wisers in the 1920s and 30s. In this long-awaited book, Wadley gives us a work of unprecedented scope: a portrait of an Indian village as it has evolved over a sixty-year period. Struggling with Destiny charts changes in agriculture, labour relations, politics, education, and the family.

### **Two-Way Movement of Sex Ratio**

Swapan Seth

The female-male ratio in the total population has long been low in India since the beginning of this century and it is declining steadily. It could suggest, apparently, to hold the idea that the low sex ratio may be prevalent in all the age groups also. But it is revealed that among the marriageable adults sex ratio has been high. A comparison among population data of India, France and Switzerland visualises a demographic paradox.

IN considering the issues of demographic transition of any particular age group or of the whole population of a particular region of a country, we find some complications and inadequacies. International, along with internal, migration makes the demographic scene ambiguous specially in respect of the female-to-male ratio (FMR) or sex ratio. This feature is particularly pertinent when a specific age group (say, the age group 20-24) is taken into consideration, the work-torce being the major constituent in such cases. There is ample scope to examine whether there is any excess female mortality (EFM) in India.

For the population of India, low sex ratio is assumed to be a consequence of EFM. [See, for example, Kynch and Sen 1983; Kumar 1989 and also for comment, Agarwal 1989]. On the issue of the high female-tomale ratio, we have to keep in mind that falling FMR may or may not be a consequence of EFM alone. Any ratio can change due to change in the value of the numerator and/ or in the value of the denominator. It may even not change at all if both of them change at the same rate and in the same direction. A change in the FMR of a particular area can, therefore occur in the same manner. A decrease in the FMR may be a result of greater increase in the number of males when compared to the female population, which may remain unchanged or exhibit a smaller increase. For the case of a growing population, other factors remaining unchanged, the same phenomenon may take place if the net increase of females is less than that of males. Therefore, a decrease in FMR does not always imply a decrease in the female population. And it also is not a fact that the male population has been remaining constant over time in India. Above all, male death rate is neither exogenously given nor fixed over time. whereas, according to common belief in deprivation of women and the like, it is generally taken as unchanging.

If a study relates to a section of a population or an age group, its findings possibly are not to be fully applicable to the whole of the population. Excess male child mortality, owing to the relative biological disadvantages of males as compared to their female counterparts, in the neonatal period favours a high FMR. But simply in view of this fact, it does not seem fully justified or logical to conclude that male mortality for the total population is high in India. The deprivation of the females in India is a well known phenomenon. The low sex ratio has been assumed to be the consequence of an excess female mortality over male mortality. As for evidence, the instance of excess female child mortality is often put forward. The question is: if girls are the victims of neglect in their childhood, then what about the rest of the womenfolk (in the adult ages)?

As regards infant and child mortality, it is often held that death rate for girls has been higher [Miller 1981] in general owing to relative disadvantage in respect of medical care and nutrition; and it is also said that there has been greater female child mortality in north India than in south India. But recent studies, using the data set from the Survey of Infunt and Child Mortality conducted in 1978, have revealed new aspects of sex and regional differences in child mortality in India. Jain (1985) observes that medical factors have a slightly greater impact on infant mortality than non-medical factors. And Beenstock and Sturdy (1990), with the help of the said data set and employing factor scale model, find no bias in favour of male infants at the all-India level. According to them, there is no clear-cut evidence of an independent north-south factor affecting sexdifferential child mortality between the two regions. However, they admit that low adult female literacy, inadequate medical care at birth and poor health may have a north-south dimension. Thereafter, according to the 1981 Census estimates, female child mortality has been lower up to age two, to be almost equal at age three but having a marginally higher value at age five Office of Registrar General, henceforth ORG, 1988]. A comprehensive nutrition survey in ten states of India during 1973-1980 showed that there was no sex bias in the level of malnutrition-led growth retardation among 1-5 year-old pre-school children [Sastri et al 1989]. So, in spite of a decrease in comparative disadvantages of girl children in recent years, and relative and absolute improvement in the life expectancy of females, which has just crossed that of males (see the Appendix), the declining sex ratio calls for further investigation together with an investigation into the sex ratio at birth.

It is a fact that the FMR in Kerala has been high when compared to that in other states of the country throughout this century. This has prompted the opinion that women in Kerala enjoy a better position. In this context, the study by Kumar (1989) regarding the impact of male emigration from Kerala is convincing. He points out that male emigration could not be a factor in pushing the FMR up during the periods when the emigration was not significant. Thus, according to him, the sex-differential child mortality in India and in states other than Kerala is an important factor for the low FMR. Is this actually so for the total population?

#### SEX RATIO AT BIRTH

In India, sex ratio at birth (SRB) has long been strikingly low, (Tables 1 and 2) and, for West Bengal (Table 3). The low sex ratio has generally been interpreted as a result of relative under-registration of female births. In this context, the Registrar General of India holds that a very low SRB "may be due to general preference for and importance attached to male births so that female births are not as much reported and registered as male births" [ORG 1976: 5] If it is so, then how are we to explain the unnaturally high SRB, greater than unity, as observed from 1977 to 1980 (see Table 2, column 6). Is it due to excessive omission of male births at the time of registration? The issue of genderspecific under-registration of child births concerns neighbouring countries also. In Sri Lanka, the SRB has been increasing during the last 100 years. This is explained by ESCAP (1976) as being due to a fuller registration of female births.

For the case of India, on the contrary, the high SRB too is attributed to under-registration of male births. Visaria (1961) infers that the high SRBs in a few regions of India are due, probably, to under-registration of male babies (p 37), though in India as a whole, simultaneously he supposes relatively less completeness of registration of female births (p 28). The high sex ratio

among children in Bangladesh is taken to be the result of under-registration of male infants and children, which might be done deliberately to protect the male children from the evil spirits [Sattar 1981]. Under-registration of male children is suspected in Nepal also [Nepal Bureau 1977]. Thus, the high/low SRB has always been attributed to under-registration of either male or female babies. But the medical registration system (MRS) free from such deficiency, also presents noticeably low SRBs.

In the countries of the Indian subcontinent with similar socio-cultural setting, there is under-registration of births of male and female babies. Under-registration of female births may be explained by the generally lower importance given to females. But the propositions explaining under-registration of male births, it seems, are less convincing.

The SRS and MRS data on SRB are qualitatively better to work with, although both of them show markedly low values. The SRB in Uttar Pradesh, according to the SRS, during 1968-1970 was 0.898 in rural and 0.900 in urban areas. It was strikingly low, which may generate doubts about the quality of the data. Instead, it is claimed in this case that "the births are checked and verified to ward off any kind of systematic bias which would lead to continuous suppression of female births. It is obvious that there is male predominance at birth ... The argument of under-registration of female deaths, as of births, can be voiced, but the data are carefully scrutinised and, in any case, are sufficiently accurate to point out the trend." [Sinha 1973: 81-82].

For the case of the state of West Bengal, the SRB at the Model Health and Ideal Registration Units, where data are collected with special care, in 1962 the value was as low as 0.884 and during the period 1965-1984 fluctuated between 0.899 and 0.972 (Table 3). An extraordinarily low SRB (0.891) has been observed through MRS on a large number (six million) of live births in different hospitals in parts of India for the period 1981-91 [ORG 1992].

Now, if excess female child mortality being an age-old phenomenon is the main factor behind low FMRs in the early age groups, then (with no matching excess male mortality in the subsequent age groups) similar low ratios should be prevalent in all of the subsequent age groups also. A high FMR has been characteristic of the age group 20-24 in India throughout this century.1 It would be interesting to compare these features with the features of similar groups in other countries, say, France and Switzerland. France has been chosen because of the factor of war which had a direct bearing upon the variability of the sex ratio of this country. The other country, Switzerland, kept itself aloof from all conflicts and, consequently,

had the possibility of maintaining natural sex ratio provided there was no unequal international migration with respect to gender.

It would be instructive to compare the contrasting features of the three countries, viz, India, France and Switzerland, as evident from Figure 1. The figure shows that India, among the three countries, has the lowest sex ratio, which falls below unity. As far as the age group of 25-29 years is concerned, France exibits a sex ratio which is either close to unity or significantly lower. The feature, however, changes during the time of war, when the same ratio manifests an upward trend. The sex ratio reached figures as high as 1.260 and 1.616 in 1921 and 1941, respectively, the two years that reflect the devastating and direct influence (casualties) of the two world wars mainly on the male population.3

Switzerland, on the other hand, presents a different picture. If we view the Swiss sex ratio, it appears to be more stable (and near about unity) than that of France. At the same time, for the age group 25-29 years, it shows slight fluctuations. The ratio was at a slightly lower level, at 0.987, in 1910, but it declined to the lowest level of 0.934 in 1970, passing

through some ups and downs but always remaining below unity in the interim periods.

Other than sex-differential mortality, sexbiased international migration can change a country's sex ratio. This may happen relatively more to the population belonging to the young adult age groups because international migration mostly pertains to these age groups. After the world wars, there was large international migration among the European countries and that had a noticeable

impact on the sex ratio because this migration in most cases was not gender-neutral

The discussion will be confined to France and Switzerland for reviewing the impact of migration on sex ratio. Limited accessibility to pre-1945 migration data prevents us from commenting on the features of that period. In the post-war period (1946-1957) emigration from Switzerland was on a smaller scale than iminigration to that country. The latter was as large as 5 per cent of the 1946 population [ILO 1959: Chapter X]. And permanent immigrants were predominantly temale workers from Italy. That seems to have pushed up the sex ratio (FMR) from 1.069 in the 1940 Census to 1.076 in the 1950 Census. Excess female immigration, according to ILO (1959: 331), "was distinct at the time of the 1950 Census, and has become even more marked since. However, more recent immigration, with a clear majority in favour of the male sex, has probably corrected it to some extent." And this was reflected in the 1960 Census, when the FMR dropped to 1.033. This phenomenon is very prominent in the work-force belonging to the age group 24-29 years, where the FMR increased from 1.018 in 1940 to 1.069 in 1950 and then declined to 0.952 in 1960. In the case of France also, migration contributed a lot in changing the sex ratio. The ILO (1959) study on the sex-differential migration will eventually be an important source in explaining the fluctuations in the sex ratio during the post-war period. The study states: "In France net immigration was probably less than I per cent of the original population tigure." In continuation, it was also pointed out that "the greater majority of the immigrant workers were men. Immigration in France, therefore, attenuated the effect of war losses on the distribution of the young adult generations. It is true that emigration cancelled out part of this compensating effect."

In the present analysis, some striking contrasts are observed in the demographic transition of India. The total population in India has a low FMR whereas that ratio is high in the young adult ages (20-24 years). On the other hand, in the case of France and Switzerland, the FMR in the total population of all ages is high but a lower value of FMR is prevalent in the age group 25-29 years in the normal periods. However, it increases in the event of female surplus immigration or male surplus emigration. Moreover, the FMR jumped up suddenly in France with the outhreak of war. The two world wars involved large military losses that led the FMR of the young adult ages to go up to an unprecedented level. Accordingly, coexistence of low sex ratio in the total population with its high level in the young adult ages of Indian population makes it interesting. And the coexistence of high FMR in the population of all ages with its low level in the normal periods at the young adult ages, as observed in France and Switzerland, presents a new dimension of a paradox of sex ratio.

#### CONCLUDING REMARKS

The factors leading to a higher FMR in the age group 20-24 years in India have been indicated indirectly through evidence from France and Switzerland. One of the possible factors is excess female immigration. But international migration for India has not been large. The effect of war has also not been devastating in terms of loss of lives. Therefore, the low proportion of males in the age group 20-24 years may be due to excess male mortality induced partly by day-to-day occupation-related risks involved for them.4 We noted earlier the difference in age specific mortality between the two sexes. According to Kumar (1989), excess male mortality in some age groups is in no way a counterbalance to EFM in some other age groups. This could be seen in an indirect way. In India the FMR at live birth<sup>5</sup> (SRB) is approximately 0.910 (Table 2). So the FMR should remain at that level if there is no excess mortality of either sex. And in the long run, the sex ratio should remain below the SRB if there is EFM. But evidently, the sex ratio in the total population has been higher, between 0.930 and 0.970. Keeping in mind the prevalent features - high sex ratio in the adult young age group, viz, 25-29 years, in France and Switzerland during war periods, and in the age group 20-24 years all the time in India - it can justifiably be held that EFM is not a fact. And as a nonexistent factor, EFM can have no influence in determining the low level of the FMR in India over a long period, viz, the current century.

#### APPENDIX

The life expectancy at birth in India has gradually improved during the 111 years between 1881 and 1992 (Table A). The transition has been in three phases. In the first phase (1881-1921) with low life expectancy, females were ahead of males. In the second phase (1922-1980), the situation changed in favour of males. In the third phase beginning from the last decade at a moderate level of life expectancy, females achieved a higher position than that of males

#### Notes

- 1 The same feature is perment also to Bangladesh, with similar socio-economic conditions, which experienced 6 to 9 per cent male deficit to females in the marriageable age groups [Seth 1989].
- 2 The decline of sex ratio, according to the ORG (1992), was not to be attributed to under enumeration of females
- 3 Approximate military losses for France during 1914-18 were 13,45,000 lives and during 1939-45 were 6,00,000 lives (Mitchell 1980).
- 4 For this point, the reader is referred to ORG (1972).
- 5 The data on sex ratio at birth (SRB) are available from Civil Registration System (CRS) But the data yielded by the CRS are deficient qualitatively as well as quantitatively (Padmanabha 1982), and so we are ignoring them. The West Bengal State Bureau of Health Intelligence data obtained from five selected

hospitals also reveals low SRBs over many years. "The Office of Registrar General, India has recently collected data on live births that took place in hospitals, health centres and institutions located mostly in urban areas. This was based on six million live births that occurred during 1981-91 in various parts of the country. The sex ratio at birth has been calculated to be 0.891. " [Nanda 1993.11] Prevalence of strikingly low SRB is accepted in the census study for the decade ended in 1981. The Office of Registrar General states, "Generally, the expected level of sex ratio at birth is 0 952 but in India the sex ratio of children ever born in total, rural and urban areas is only 0.894, 0.896 and 0.885, respectively" [ORG, 1988a 7]. And the Sample Registration System (SRS), which too is a reliable source, confirms the low SRB in India at the values of 0.923 and 0.928 in 1968 and 1969, respectively [ORG 1970]. The SRB was 0.922 in rural areas in 1966-67 [ORG

### **Occupation and Inherited Status**

#### Ramesh Kamble

Dalit Movements and Meanings of Labour in India by Peter Robb (ed); Oxford University Press, New Delhi, 1993; pp 354, Rs 290.

Caste system in India is not merely a division of labour. It is also a division of labourers.

- B R Ambedkar (in Annihilation of Caste)

AN enquiry into the link between occupation and inherited status, reflected in the above quotation, is the focus of this volume comprising I I essays and a long introduction by the editor. The volume seeks to illustrate that despite the experiences of colonialism and capitalism, the meanings of labour in India continue to be influenced by the social and cultural conditions, beliefs and practices. The Indian experience of social and economic status reflects brahminical hierarchies rather than those envisaged in colonialist or capitalist experiences.

The volume addresses three main issues: firstly, evolving and contrasting meanings of labour in India; secondly, how labour conditions and organisation altered in India from 18th century to the present day; and thirdly, how far these changes were contested. The first three essays in this collection seek to understand the evolving and contrasting meanings of labour. Involved here is a critical assessment of concepts such as 'wage labour'. 'class' and 'proleterisation'. The chapters four to eight and nine to eleven deal with two aspects of dalit movement - migrations and protests - respectively. They seek to understand the impact of these movements on meanings of labour and the problem of traditional hierarchies in India. The last essay analyses the conditions of labour in India's steel towns and illustrates the feudal character of these modern industrial organisations.

In his introduction Robb raises the question as to whether specific and cultural features have been merely a diversion from the expected course of development or do they present specifically south Asian forces in the economy, of labour and social status. He points out that in terms of labour recruitment, management, control and surplus appropriation in India we witness continuous relevance of social and cultural conditions. They have been perpetuating the servility of labour in India Robb concludes that the powerful and intrusive force such as colonialism, capitalism, communications or English law influencing the Indian economy and society, have coexisted with the force of specific cultural memory in India.

I am indeed in agreement with Robb's contentions. However, certain positive consequences of the British rai for dalits should not be ignored. The recruitment of dalits in the British army and textile mills, for instance, had important implications for their selfhood and protest. It resulted, apart from economic independence, from enslaving social structure, in creating a sense of self-dignity which they were deprived under enslaving social structure. Secondly, the exposure to European egalitarian ideas through English education also played an important role in creating new awareness about oppressive Indian social structure. Social thinkers and reformers such as Jotiba Phule, M G Ranade, B R Ambedkar were deeply influenced by European egalitarian ideas. Thirdly, educational opportunities and political safeguards received by dalits under the British rule, though characterised as 'divide and rule' policy, generated avenues for qualitative social mobility.

David Washbrook in his article, 'Land and Labour in Late 18th Century South India: the Golden Age of Pariah?', contrasts labour conditions in 18th century to that in the 19th century, and maintains that the labour conditions in 18th century were characterised by diversity of choices (differentiation), subject to exchange relations favouring occupational mobility and, involving a complex system of rights in social product. The merit of Washbrook's contentions should be evaluated in the light of the following questions. Firstly, does the 18th century diversification of labour in case of the landless dalits involve a choice or is dictated by their necessity of bare minimum survival? Secondly, if labour was created by the exchange relations, did the landless dalits have any say in deciding the terms of exchange in the framework of rural economy? And even if they had, was it not due to the availability of employment in textile industry and army rather than in traditional rural structure? Thirdly, should not the 'inam' lands and the 'honours' of temples, courts and clans be viewed as attempts aimed at creating loyalties to maintain the existing hierarchies and hegemonies and offset any dissent against the system? Fourthly, Washbrook's contention that under the 'adimai' system of agrestic servitude adimais were not without personal rights and that they existed in relations of 'mutual obligations' with their masters. The adimais depended on their masters for subsistence and protection while the masters depended on them for regular labour supply. This raises a question: did adimais under the adimai system of servitude have any choice but to remain tied to their masters for subsistence and protection? And did the masters really honour the relationship of mutual obligation? The author himself points out that this relationship could be easily abrogated if obligations on the part of adimais were not met or violated. Whereas, the masters did sometimes violate their obligations towards adimais without any punitary measures. The rights of adimais under this system were therefore more theoretical than real. Hence, the author's contention that there was a scope for selfenhancement of adimais under this system is not convincing.

Moreover, Pariah's occupational mobility - the notion of their 'golden age' - owes to their cultivation of hazardous island, employment in less skilled spinning and weaving and in company's army. This means that Pariahs were forced to cultivate dangerous lands, seek employment in unorganised textile production and in army because they were ousted from village land. But, did the system of sharecropping. entitlement to 'inam' lands and 'honours', and the golden age of Pariah radically alter the hierarchical and hegemonic social structure? The everyday experience shows that despite their relative occupational mobility and consequent economic 'success', the Pariahs even today are segregated in every walk of life.

In the next chapter, 'Work Constructed: Ideological Origins of Labour Law in British India to 1918', Anderson has critically examined the genesis and nature of colonial labour law. He points out that though the viability of British raj depended on successful harnessing of indigenous labour, the organisation of work and policy on labour were not subjects of explicit formulation till the early 19th century. The Industrial Commission, appointed in 1906, was the first step towards a systematic policy on labour, and the establishment of ILO in 1919 provided inspiration for legislation on labour. This legislative intervention, however, was limited to certain areas of economy and most of the actual organisation of work was carried out through local mechanisms as it helped the colonialist's goal of capital accumulation. Further, according to the author, the official recognition of labour and the legislative in which colonialist's interests were at stake. Thus, Anderson maintains that the British legal formulation on labour was haphazard and ad hoc in nature.

In chapter four, 'Oustating Singbonga: The Struggle for India's Jharkhand', Corbridge describes how the processes of Hinduisation and modernisation oustated tribal communities from their natural economy, and subsequent resistance to these attempts of reshaping their environment and identities. Corbridge points out that forests were not merely sources of subsistence for tribal communities but also central to their identities and solidarities. Under various rajahs and British state's forest policy tribals were deprived of their private collective land rights. Furthermore, the postpolicy independent India's developmentalism and tribal's integration into the mainstream has been viewed by tribals as intruding on their natural economy and identity.

An interesting account of continuity between the origin of work in Santhal's mythology and their experiences of labour in traditional and modern conditions is offered by Marine Carrin-Bowez in 'Forest to Factories: Santhal's Conception of Work'. The author points out that notions of work and death are missing in the initial phase of Santhal mythology, and are introduced by outside forces, i.e. through their experiences with Hindu rajahs and the colonial state. Thus, the depiction of labour camp corresponds to their estrangement, oppression and exploitation resulting from imposed system of work: Hindu rajahs as tax-inspectors; and the captain saheb subjecting them to hard labour. Hence, in their mythology the notions of work for others and the conception of work devoid of social obligations (wage-labour) are located in the realm of death—outside society.

Chapter six, 'Tribal and Indentured Migrants', focuses on migration and incorporation of Indian labour in plantation and industrial production. Thus, as against the divergent and stereotypical analysis of indentured and tribal migration, evident in 'voluntarist' (considering migration as creating employment opportunities for the marginalised) or the 'objectionist' (considering migration as fundamentally coercive) orientations, the author argues for the need for multi-layered approach because the realities of tribal and indentured migration exhibit a complex arena of choices and coercion. Further, experiences of migration show that they are caused by both social and economic factors.

Arjan de Haan in 'Migrant Labour in Calcutta Jute Mills' concentrates on instability of labour force and it's implications for proletarisation of working

THE HIM IN INDUNI VIRGINISALIVIIS. 11143, 43 opposed to the earlier understandings of instability of labour as mainly caused by the links between agricultural hinterland, the author maintains that the instability of labour in Calcutta Jute Mills was caused by the possibilities of alternative urban employment in informal sector. Thus, the unskilled migratory labour from Bihar, Orissa and United Provinces had diverse labour choices such as earth-work on railways, field labour, digging and clearing of tanks, repairing roads and factory employment. The skilled labour, mainly Muslim weavers from the United Provinces, enjoyed mobility between and within various departments of mills. Further, as far as the labour recruitment and control is concerned, it continued to rest, till 1980, in the hands of Sardars. For, apart from being recruitors, they were also organisers and breakers of strikes, and induced workers to change mills. Hence, Haan's contention implies that Marxist categorisation of Indian proletariat created and subordinated to capital is one dimensional and devoid of actual realities pervading the realm of labour. Further, Haan argues for the need of analysis which can explain how alternative and informal employment was interlinked with capitalist production and the adequate explanation of social psychological implications of spread of capitalism.

The next three essays deal with the dalit protest and its impact on formation of identities and meanings of labour in India. Thus, in 'Intimations of Equality' Dilip Menon deals with formation and reconstruction of identities and notions of community in the specific social context of religious festivals. The author points out that these religious festivals involved social relations of caste hierarchies and enacting of corresponding behaviour and designated functions. However, they also exhibited assertions and transformations of identities by the lower castes. Thus, in the background of formation of iniquitous community around the religious festivals of shrines managed by the dominant Nayar 'tharavadus' (households), the author describes 'Tiyyas' (toddy-tappers) attempts of creating parallel shrines and temple establishments and thereby projecting the idea of community of equals. However, this attempt by Tiyyas was a limited one as the Nayars did not worship importantly, Tiyyas prevented other lower castes (untouchable Cherumas and Pulayas) from worshipping at these temples.

Nandini Gooptu's essay, 'Caste and Labour', deals with the social and labour experience of dalits in major towns of Uttar Pradesh and their reconstruction of selfidentity and history in this urban social context. Thus, the late 19th and early 20th centuries migration of dalits to towns marked a change from exploitative social relations of work in the rural set-up. Instead of servile labourers of the higher castes, they became employees of municipalities and in other services. However, despite this wage employment, caste segregations in employment and settlement did not cease to exist. For, even in urban centres they continued to be engaged in 'impure' and menial services and settled in secluded pockets of urban outskirts often devoid of any civic amenities. Amidst this background of contrary experiences of relative freedom and caste segregation, the author locates the genesis of 'bhakti' resurgence and the adi-Hindu movement. It should be noted here that both these attempts of radical reformation of self-identity were rooted in the traditional cultural setting, whereas Ambedkar's attempt of reconstructing identity for dalits, though drawn from the past, involved critical reinterpretation of that past. Thus, Rodrigues' essay, 'Making a Tradition Critical', focuses on Ambedkar's attempts of reconstructing Buddhism as a global ideology for future. This reconstruction, the author points out, is influenced by Ambedkar's quest for emancipatory ideology for untouchables, and also for reshaping the face of Indian society. Rodrigues reviews Ambedkar's writings on Buddhism especially Buddha and His Dhamma, and shows that Ambedkar conceived Buddhism as appealing to critical reason and experience, and as involving a social message: justice, love, liberty, equality and fraternity, which was ignored in earlier writings on Buddhism.

This volume addresses many vital facets of dalit labour and their implications for evolving meanings of labour, and the question of social status in India. The essays exhibit a painstaking historical research and multi-dimensional nature of analysis of the subject matter.

## Che at 23: Making of the Revolution's Poster-Boy

Vijay Prashad

The Motorcycle Diaries: A Journey around South America by Ernesto Che Guevara, Fourth Estate, London, 1996, pp 155, £5 99

ALMOST 30 years after his untimely death, Ernesto Che Guevara's diaries from a motorcycle trip made in 1951-52 were published in Havana, Cuba In 1995 Ann Wright's fine translation appeared in England under the imprint of Verso who produced T shirts and calendars of the revolutionary eating an ice cream to announce the book and introduce a new generation to the phenomenon of Che. The book was reviewed by the conservative Time's (Easy Rider meets Das Kapital), by the liberal Guardian (It's true Marxists just wanna have fun') and by the trade journal Bike New ( Politically correct revolutionary hero? Perhaps a few years later, but in this account Che Guevara comes over as one of the lads. ) The consensus was that this was a 'lusty travelogue which was 'free of pomp and full of life" (as the publicists of Fourth Estate put it for their 1996 paperback release) What the publication hoopla missed was the agonised and tortured 23 year old from a bourgeois family who tried to square his faith in the ideologies of liberalism with the realities of capitalism, the journey, like the 1959 trek through the Sierra Nevada in Cuba, was the chrysalis which produced the Socialist Man' who went amongst the peoples of Bolivia in 1966 to create the proletarian revolution in the continental manner of the carlier bourgeois revolutionary Simon Bolivai

In 1951-52 Che (which means friend in the pators of Argentina) left his native country in the company of a friend with whom he shared La Ponderosa (the Powerful One) a 500cc Norton motorcycle. They planned to ride from Argentina up the west coast of South America through Chile Peru Colombia and finally Venezuela. The two friends with their basic medical training complete left to discover their continent and to explore lives fair removed from their own bourgeois families. Many of their encounters reaffirmed, the worst elements of their socialisation, while others tugged at the contradictions which lurk in the minds of us moderns.

The man who emerges in the diaries is by no means the perfect hum in being who congeals within himself the noblest hopes and aspirations of our collective civilisation. Here is a young min who chears for wine who deceives for a ride on a truck who makes strong prejudicial remarks about the

Amerindians and who offers himself up as a sexist pig. Che, brashly, recounts a village dance at which he dances with a young woman who at first appears to want to go outside the hall with Che, but then changes her mind I was in no state to listen to reason.' Che wrote 'and we had a bit of a barney in the middle of the dance floor, resulting in me pulling her towards one of the doors with everybody watching' (43) Fortunately for the young woman, a strong kick at Cheresulted in some confusion which brought the other villagers to her assistance The incident occurs shortly after Che leaves his france behind in a gust of sentimental poetry of undying love Both visions of women confirms once again the common denial of full moral equality to women the Cuban campaigns forced the revolutionaries to reconsider their ideas regarding women, for many of their comfades on the front were women Communism as political practice, does not automatically eliminate all that is socially undesirable rather to paraphrase Lenin it insists upon making the various struggles clearer broader more open and sharper( A Caricature of Marxism' October 1916) The struggle for women's equality is a fight for the recognition of the moral equivalence of women and men as well as the attendant fight for economic justice. Che would only confront these lessons in Cuba amongst a politically active group of women whose materialist feminism was nuitured by their sacrifices in the struggle. Most reviews of Che's drary avoid the complexities of his development and use such sexist remarks to dismiss entire traditions of political thought and practice. Marxisin must continuously acknowledge and relentlessly criticise all forms of sexist ideology and practice. The publication of these dianes offers us an avenue to confront the issue head-on

The trip proved to be decisive in Che's life for it was during this journey that he came into contact with the fundamental oppression of the Americans who claim European ancestry. In Chile amongst the Ayamara, Che felt he could catch an occasional glimpse of what life must have been like prior to the Spanish Conquest. But the people, he reflected, "are not the same proud face that time after time rose up against linearule and forced them to maintain a permanent army on their borders, these

people who watch us walk through the town streets are a defeated race They look at us meekly, almost fearfully, completely indifferent to the outside world. Some give the impression that they go on living simply because it's a habit they can't give up" (77) Che came to understand the depth of the exploitation of the Amerindians in the various mines along the western mountain ranges of Chile and Peru For the Euro-American masters, the Amerindians were no better than beasts of burden At one point, Che intervened to relieve the burden of an Amerindian "there was no sign on his enigmatic face to show whether he appreciated our gesture or not" (108) During these travels. Che was confronted by the labyiinth of capitalism's exploitation he had not yet come to appreciate the depth of popular unrest and the means for that unrest to lead to social revolution. In a letter to his family from Columbia, he complained of the semi fascist conditions and exclaimed. 'If the Columbians want to put up with it good luck to them, but we re getting out of here as soon as we can' (144) Not a decade later Che and his Cuban triends would ofter the opposite assessment it is time to buckle down for a tight

In the aftermath of the Cuban revolution (1959). Che wrote an account of guernila warfare which was published as Episodes of the Revolutionary War (New York International Publishers 1968) After an early debacle the Granma revolutionaries headed for the Sierra where they lived amidst the peasantry 'Guerrillas and peasants began to merge into a solid mass. No one can say exactly when in this long process the ideas became reality and we became a part of the peasantry. As far as I am concerned the contact with my patients in the Sierra turned a spontaneous and somewhat lyrical decision into a more serene force one of an entirely different alue Those poor suffering, loyal inhabitants of the Sierra cannot even imagine what a great contribution they made to the forging of our revolutionary ideology (Episodes, 57) If the Sierra made the union between theory and practice more than 'mere theory, the 1951-52 journey played an initial role in the creation of a revolutionary. At the close of his diary, Che wrote of the emergence of self-consciousness amongst the oppressed and that he would take his humble place amongst the people. As if to fortell his murder in Bolivia on October 8, 1967, Che wrote the following prosaic lines " I, the eclectic dissector of doctrines and psychoanalyst of dogmas, howling like a man possessed, will assail the barricades and trenches, will stain my weapon with blood and consumed with rage, will slaughter any enemy I lay hands on And then, as if an immense weariness were consuming my recent exhibitation, I see myself being acrificed to the authentic revolution, the reat leveller of individual will, pronouncing he exemplary mea culpa. I feel my nostrils lilate, savouring the acrid smell of unpowder and blood, of the enemy's death;

brace my body, ready for combat, and repare myself to be a sacred precinct within which the bestial howl of the victorious proletariat can resound with new vigour and new hope" (152).

For the man born on the anniversary of he Bastille (the inauguration of the French evolution), this journey was essential for it woke him to the realities of our world and it drove him towards a reassessment of his future as a bourgeois Argentinian doctor. The belief in the power of human struggle and in the impossibility of capitalism to solve its crises, pushed Che towards the ragged band of Cubans who waited in Mexico under the able command of the basketball champion Fidel Castro. With such gems as the motorcycle diaries hidden in the archives of Havana, one can only hope that we will soon be offered the diaries of Castro: with bated breath

### **International Law and Human Rights**

A G Noorani

The Human Rights Committee: Its Role in the Development of the International Covenant on Civil and Political Rights by Dominic McGoldrick; Oxford University Press, £ 19.95.

NDIA ratified, on March 27, 1979, the nternational Covenant on Civil and Political Rights as also the one on Economic, Social and Cultural Rights. Article 40 of the Covenant on Civil and Political Rights bands he state parties "to submit reports on the neasures they have adopted which give effect to the rights recognised herein and on the progress made in the enjoyment of hese rights". These reports are examined by a Human Rights Committee set up by Article 28. It comprises 18 experts elected by the states parties to the Convention.

India submitted its first Report on July 4, 1983, which the committee examined on March 28 and 30, 1984. It sent its second Report, after seven reminders, on July 12, 1989. The committee examined it on March 26 and 27, 1991. The third Report, due on July 9, 1990, was submitted in late 1995 or early 1996. In the two proceedings before he Human Rights Committee, India's attorney general was grilled by the members and the inadequacies in the Reports were exposed. There was little press comment on these proceedings in India.

It would seem that the government's indifference to the HRC is matched by that of the media and, sadly, also human rights activists. This is in glaring contrast to the interest shown in the HRC's work by lawyers and human rights activists in Sri Lanka, to go no farther.

This book is a definitive study of the committee. It is, in a sense, a study of the case law built up by the HRC over the years. This is done within the general context of the development of international law on human rights since 1945. It contains a mine of information. The articlewise commentary on the Covenant makes it an indidpensable

source of reference. Of the nearly 100 states which have ratified the Covenant, nearly half of them have ratified also the Optional Protocol which empowers the HRC to receive complaints from individuals. India is not one of them, however. The book provides a model form of such a complaint besides throwing light on the procedure.

The work traces the history of the Covenant, describes the working of the committee and its legal status and the system of periodic reporting by the states parties.

Since the Articles of the Covenant are akin to the fundamental rights in Part III of the Indian Constitution, this book can provide considerable help to courts and jurists in the interpretation of the rights. That includes, for instance, the rights of prisoners, of persons accused of crime and, of course, the precious civil rights of citizens. Article 19 embodies the right to free speech (hence, the name which the London-based organisation has adopted — 'Article 19').

Likewise Article 9 of the Covenant guarantees protection against arbitrary arrest and detention. India's instrument of ratification contains certain reservations; one of them relates to preventive detention.

While dealing with individual cases, the HRC also provides 'General Comment'. Indeed, Article 40(4) of the Covenant requires it to do so. Let us consider how the HRC applied Article 19. Based on its proceedings, the author records: "Members of the HRC have attached great significance to how legal restrictions and limitations operate in practice. How and by whom were they interpreted and enforced? How was their discriminatory application avoided? State representatives are often requested to provide statistical information on the availability and circu-

lation of books, newspapers, magazines, and other publications. Other information commonly sought concerns the operation of licensing regimes, direct or indirect support or control or authorisation of the press, the languages of publications, the variety of cultural performances, the possibility of subscribing to foreign newspapers and periodicals, restrictions on the activities of foreign correspondents or dispatches from foreign press agencies. During consideration of the report of Guyana, Professor Tomuschat raised the question of indirect practical limitations on freedom of expression as a result of difficulties in obtaining newsprint. Such information provides invaluable indications of the practical state of freedom of expression in a given country.'

On both occasions when India's Report was considered, HRC's members politely but firmly told its attorney general that it was no use citing texts of laws. They wanted to know how the laws were enforced – e g, on dowry deaths.

The author is by no means uncritical. He points out sharply the flaws in the HRC's approach to a good few thorny issues. This is due largely to differences among members of the HRC.

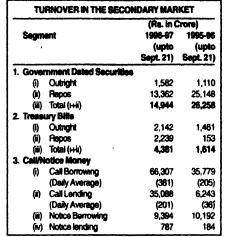

The author is particularly critical of the HRC's rather unsatisfactory practice on Article 19: "In anumber of respects, however, the HRC's practice concerning Article 19 is perhaps the most disappointing of the articles examined in this work. The right to hold opinions has been little dealt with. The considerations of the HRC and the General Comment on Article 19, apart from the brief reference to the development of modern mass media, have been confined to rather narrow aspects of the right to freedom of expression. Very little attention has focused on its more positive and progressive aspects although one of the newer HRC members, Mr Mommersteeg, appears to take a particular interest in this area. The freedom to seek. receive and impart information and ideas of all kinds is open to a much more dynamic approach in terms of the openness of local and national government, and accessibility of the various forms of media to political, ideological and social groups, access to official records and other public documents, developments concerning vital commercial information, the increasing use of computers and the consequent demand for personal data protection."

In India debate on issues like personal data protection and the content of the freedom of cyberspace have yet to begin. These affect the well-to-do. The application of various rights in the context of grinding poverty in the rural areas deserves closer study than it has received. Public interest litigation is just one weapon. Many more need to be devised.

## SECURITIES TRADING Regd. Office

has been significantly higher than that in the corresponding period of the last year as would be observed from the following table:

The Company, it will be observed from the above figures, has also been able to secure a significant foothold in the call money market during the current financial year. However, the Company's turnover in repos declined considerably during the current financial year so far as compared with that in the last year. This is mainly on account of low level of market interest in repo transactions in view of the easy conditions in the call money market.

The Company has been regularly participating in the primary auctions of both the Government dated securities and Treasury Bills. As a Primary Dealer, the Company has already fulfilled its annual bidding commitments for 1996-97 in respect of both the Government dated securities and Treasury Bills. The Company expects to significantly exceed its bidding commitments for the current year its success ratios at auctions during the current financial year so far (upto Saptember 21, 1996) has been 72 per cent in the case of Government dated securities and 41 per cent in the case of Treasury Bills as against the specified minimums of 33.33 per cent and 40 per cent respectively.

#### **Recent Market Trends**

In keeping with the easy conditions in the call money market since April 1996, demand for Treasury Bills of both 91-day and 364-day maturities in the primary market has picked up Consequently, the cut-off yields at the auctions of Treasury Bills have been successively showing downward trends. The cut-off yields at the auctions of 91-days Treasury Bills have registered a steep fall from 13 per cent in April 1996 to as low as 8.50 per cent in August 1996. However, in some very recent auctions the trend seems to be reversing. In respect of 364-day Treasury Bills, the fall in yields has been less steep than that for the 91-day Treasury Bills (from 13.16 per cent in April 1996 to 12.65 per cent in September 1996). The Reserve Bank has also signalled a softening of interest rates on Government dated securities through issue of 10-year Government Stock on June 24, 1996 on a fixed coupon of 13.85 per cent as against 14 per cent last year. However, softening of yields was not reflected in the auctions ol Government dated securities held for shorter maturities. For instance, at the auctions of 3-year and 2-year Government Stocks held in June/July 1996 the cut-off yields were higher at 13 70 per cent and 13.62 per cent respectively, as compared with the cut-off yields of 13.65 per cent and 13.50 per cent which emerged at the last year's auctions for similar maturities. This indicates that the market still expects the interest rates on Government Stocks to remain high. With the coupon rate on 10-year Government stock pegged at 13.85 per cent and the coupon rates emerging from the auctions in the range of 13.62 - 13.75 per cent for 2-year to 5-year Government stocks, the yield curve has flattened and in such a situation Government does not seem to have much manoeuvrability in accessing the market with stocks of maturities of 5-years and above.

During the current financ secondary market for Gothanks to the easy condition the April - June 1996 quar transactions in Governmen Public Debt Office of the R s. 2,632 crore and Rs. 6, Between Rs. 1,378 crore an improvement over the mon in the range of Rs. 754 crore in respect of Treast September 1994 - March I

#### Performance of the Company

The report of the Directors and the audited accounts of the Company for the year ended March 31, 1996 which was the first full year of the Company's operations, have already been circulated 1, therefore, propose to touch only briefly upon some of the main features of the Company's business operations during the year under review as also in the current year so far.

The turnover of the Company in the secondary market, both in Government dated securities and Treasury Bills, was higher during the year at Rs. 170,282 crore and Rs. 2,674 crore as compared with Rs. 39,631 crore and Rs. 310 crore respectively, in the preceding year. The daily average borrowing and lending in the call money market during the financial year 1995-96 was Rs. 237 crore and Rs. 112 crore respectively, as compared with the daily averages of Rs. 61 crore and Rs. 26 crore respectively, in 1994-95.

The Company's profit before depreciation and taxation during 1995-96 was higher at Rs. 67 75 crore as against Rs. 7 94 crore during the proceding year (ten months working). After providing for depreciation and taxation, the net profit in 1995-96 amounted to Rs. 36 42 crore as against Rs. 4 15 crore in 1994-95.

Your Directors have recommended a maiden dividend of 5 per cent (subject to tax) for the year ended March 31, 1996 which, if approved, will absorb Rs. 25 crore

During the current financial year 1996-97 (upto September 21, 1996) the Company's tumover in the secondary market on outright basis, both in Government dated securities and Treasury Bills.

I am of d be paid under a simple and sent one and we should avoid tructure

ual Geheral Meeting of the Serve Bank might consider ms of participants and eligible must acknowledge that the enew issues of Government

dated securities as eligiable for repos. However, the range of participants in the market is still rather restricted. I would again urger that broadening of the repo market by inclusion of additional participants needs urgent consideration. An active repo market, apart from providing assured liquidity to holders of gilts, could also provide access to funding to PDs at relatively low interest rates. It is worth noting that in most of the active markets in Government securities in other countries, the funding source most extensively utilised by primary and other dealers in Government securities is the repo market. An active and systematised repo market has the potential of attracting high voloume of short-term corporate and institutional liquidity and that too on a fully secured basis as far as the lenders are concerned. This is the reason why repo market in Government securities has been so widely used in other countries. While recognising the background to the current restrictions imposed on the repo market and the apprehension that the regulatory authorities have in this regard, I would like to urge that efforts should now begin towards broadening the repo market. With the introduction of the DVP system, the risks are now much better controlled. If for permitting newer participants in the repo market, some further system development in the financial market need to be taken in hand that task may be addressed on a priority basis. In this connection, a view has also been expressed in recent times that repo transactions may not be conducive to the development of an outright market in India, for the availability of the repo route might discourage investors from opting for outnight transactions However, I believe that an active repo market can only induce investors to invest in gifts which they may not otherwise be willing to do because of liquidity and price risks. This also is the general experience in most markets not only with gifts but also with many other financial securities. To fear that the availability of repoloption might discourage holders from opting for outright transactions is like fearing that a child may not want to walk or run if it is first allowed to crawl

The Institutions of PDs is a new one in India. Given the early stages of their evolution and the current state of the Government securities market, PDs operate under rather difficult conditions. Dealing in Government dated securities can be quite risky in view of significant interest rate risks that PDs have to boar. Absence of hedging instruments in the Indian market makes the situation more complex. It is, threfore, only fair that PDs engaged in the pioneering task of establishing an active secondary market in gifts be given appropriate tax relief on their profits at least for the first five years of their operation as has been given to several institutions in the past and to a few institutions in this year's budget. This would enable PDs to concentrate on developing an efficient market and build up reserves without having to worry too much about return on their capital.

Widening of Investor Base in Government Securities While much has been done in the recent years to develop an active secondary market for Government securities which is now showing some evidence of increased activity, the real challenge in creating an active and vibrant Government securities market lies in widening the investor base by attracting retail, institutional and corporate investors who would be willing to invest in gifts by choice and not by statutory compulsion. However, interest from such investors is yet to emerge. The reasons are not far to seek One of the major impediments in bringing the retail investors into the fold of Government securities market is the wide differentials in yields or Government securities and on bonds issued by top rated issuers, including State owned institutions and entities Retail and even institutional investors perceive little difference in the risks of investing in such higher yielding bonds and in Government securities. In fact, the new generation of younger investors hardly ever consider investing in Government securities and this also because of lack of familianty with this kistrument There is, therefore, an urgent need to promote and publicise Government securities as an attractive investment option - as the only investment totally free from default risk because of the taxing powers of the Government. PDs, I am sure, will be happy to participate actively in such promotion efforts under the leadership of the Government and the Reserve Bank

There are also procedural difficulties that investors in Government securities have to contend with - both in subscribing to these securities and receiving satisfactory service as an investor. There is a need to offer retail and other non-SGL account holding investors efficient, book entry based custodial services. The banking system and the other financial services institutions will need to address this requirement. In my address to the shareholders last year, I had suggested that the Mutual Fund industry might consider setting up separate mutual funds dedicated to gilt as was the trend in many developed countries The Reserve Bank has also since agreed to provide liquidity support to mutual funds dedicated to gifts to extent of 20 per cent of their holding of gifts and also to make available to them current account and SGL facilities. I would, therefore, retterate my earlier suggestion to Mutual Fund Industry, for some of the difficulties such as those relating to procedures and liquidity could be taken care of by such Funds which could be efficient vehicles. for attracting investors into the gilts market. Regulatory authorities may also like to examine what other facilitating measures might be necessary to encourage Mutual Funds to set up dedicated

Finally, I would like to bring up the issue of treatment of interest income on Government securities for tax purposes. Not only is there no specific exemption from tax on such interest as there is in respect of income from Mutual Funds, companies investing infrastructure funds, etc., there is also deduction of tax from income at source on such securities. The tax rebate under section 88 of the Income-tax Act, 1961, available to many other investments does not extend to investment in Government securities. Given the relative unattractiveness of yields on Government securities as currently perceived by investors and the rather favourable tax treatment offered to many other investments, the ground is really titled against. Government securities. The Government needs to consider granting appropriate tax incentives to the investors in gills, which, after all, are their own bonds, and in units of Mutual Funds dedicated to gilts, in the same way have done for investors in other selected securities. Exempting interest on Government securities received by retail investors from tax deduction at source would also go a long way to help I sincerely hope that the Government will consider these aspects urgently and favourable as otherwise it would be difficult to create a real investor base in Government

### **Future Prospects**

During the current financial year so far, your Company has done reasonably well in terms of turnover and profits. The profit before depreciation and tax during the first six months of the current financial year is well ahead of that in the corresponding period of last year. Judging by the performance of the Company so far, it is fair to estimate that the Company's turnover on outright basis and profit would significantly surpass the levels achieved last year However, I must add that the business of dealing in Government dated fixed income securities is somewhat risky as even a slight upward movement in yield curve could result in significant depreciation in the value of the portfolio. Similarly, a rise in call rates could significantly raise the funding costs. You Directors are fully conscious of these risks and the need to review the various risks management processes from time to time. Your Company would continue to work on commercial principles to generate satisfactory return on shareholders investment. At the same time, it would, in its role as a leading Primary Dealer, strive in every possible way to fulfil the objective of developing an active secondary market for Government securities

#### Acknowledgement

I take this opportunity to thank the Government of India, Government of Maharastra, the Reserve Bank of India, Commercial Banks and Co-operative Banks and All-India Financial Institutions for their co-operation and support. I would also like to place on record my appreciation of the sincere and dedicated efforts put in by the Company's team of officers and teatiff working as they often do in difficult conditions, for the encouraging performance of the Company during 1995-96 as well as during the current financial year so far

## **Indian Planning and Liberalisation**

### Kamai Nayan Kabra

The Eighth Plan marks a change, rather a far-going transformation, of the policy regime which formalises, carries forward and openly puts the seal of approval on a number of halting, unannounced series of policy changes spread over a long period. These changes go towards a redefining of the policy outcomes and thus constitute a serious rewriting of the content of India's development strategy.

IT has been maintained that India is witnessing a transition "from the gradual structural changes in the post-war period" to "structural adjustment" as a guiding principle of economic policy in the postcold war period" [Rao 1995:12]. The Eighth Five-Year Plan initiated during the period of structural adjustment policies (SAP) has been claimed to be a different kind of a plan by its authors. This exercise intends to examine this claim and, generally, to analyse the relationship between Indian planning and liberalisation. In the introductory section a parallel is drawn with an earlier Plan's similar experience and the planner's recent claim about the changed character of the planning process is contextualised and elaborated.

Then, we go on to examine how, why and to what extent and in what form the liberalisation drive impacts the system of development planning. This section attempts to bring out the nature of the consequent change in development planning, both in its content and methodology. In this process we also touch upon the question of the likely effects of these changes (liberalisation a la structural adjustment) on the hitherto nonetoo-high effectiveness of India's development planning, resulting basically from the fact that since "Planning is not used to shape institutional structure of the economy" that structure has "come to shape the process of planning and economic policies in general " [Kurien 1987:28]. As we see below similar processes seem to be operation during the Eighth Plan period as well.

Something like what happened in late 1960s to Indian planning seems to have repeated itself in the early 1990s. During the earlier period what took place, in the words of an expert closely associated with national planning, was "an unvarnished plan holiday, surrender of planning and policy initiatives to current economic, industrial, and financial management, deferment of vital longer term investment in power and transport and new industry... some loss of perspective in relation to the growth of economy and transformation of its social and institutional structure, including unhappily, a further weakening of the sense of concern over the problems of

unemployment and underemployment" [Singh 1979:9-10]. Thus, to continue the quotation, "except at some significant points, the Fourth Plan for the years 1969-74 turned out to be a plan for a period of transition, influenced excessively by anticipations of the impact of new technologies on the prospects of agriculture growth. Basic issues affecting employment, small and uneconomic holdings, landless labour, the state of the household and unorganised economic activities, failures in social development, and the growing social and economic imbalances being generated within the economy were being swept away too soon under carpet, perhaps unwittingly, through the very process of planning which, it had been earlier thought, would become the principal means for removing the fundamental constraints and impediments standing in the way of growth and development and solving the problem of poverty"... (Idem)

It seems, there is an uncanny repeat show of nearly a similar situation with respect to the Eighth Plan. After two years of Annual Planning, which meant a second round of formal plan holiday, like the First Plan holiday of 1967-69, the Eighth Plan for the period 1992-97 was approved by the National Development Council. Like the surrender of the medium run plans and its substantive content to the exigencies of short-run economic management in areas of trade, industry, balance of payments and fiscal policies in 1969, the Eighth Plan approved in 1992 has also decided to focus on "clear prioritisation of sectors, projects, for investment in order to facilitate operationalisation and implementation of the policy initiatives taken in the areas of fiscal, trade and industrial sectors and human development" (Eightin Five-Year Plan; Vol 1:9) This means prior acceptance of the fiscal stabilisation and the structural adjustment programme (FISSAP), which is styled after the 'Washington Consensus' [Williamson 1993], and is basically a response to the external forces and the needs of the creditor ('donor') nations [Bienefeld 1993; Streeten 1993]. Instead of responding to the longer term issues, constraints and impediments which got dramatically manifested in the crises of 1991, the Eighth Plan has taken the "operationalisation and implementation" of the FISSAP as the first point of its "fourfold focus' and the priorities of investment sectors and project have to be designed in manner which facilitate this 'focus'. This is like the Fourth Plan's acceptance of the imperative to adopt the new technological approach to agricultural growth (or, agricultural sector liberalisation involving greater commoditisation, marketisation and industrialisation of agriculture) after discarding reliance on agrarian restructuring and facilitating the transition to this newly adopted growth path.

Like all historical analogies, this one too ends before long and acquires its inevitable historical specificity. The riveting of the Plan to the new techno-economic, 'betting on the strong' strategy of agricultural growth was aimed, inter alia, at ending the dependence on direct food imports and the ship-to-mouth existence. It was, after all, the adoption of a path and approach which brought the institutional content of the agricultural strategy on par with that which was adopted in effect for the industrial sector, notwithstanding the rhetoric of the Industrial Policy Resolution of 1956, or of the 'socialistic pattern of society'. The change in the late 1960s concerned the content and a component of the strategy of development planning. No claims were advanced concerning a change in the methodology and the role of planning and the interface between planning on the one hand, and the economy, state and markets, on the other. It is true that the role of the market forces in agriculture was enhanced but it left virtually unchanged the methodology of state intervention in agriculture through the plans.

But the change in early 1990s has been claimed to be a change in both the content of development strategy and the methodology of planning under the impact, inter alia, of global trends. This may imply that the change experienced in the early 1990s is not just a sectoral one like that in the late 1960s but economywide, nay, covering the entire political economy of India and her interrelationship with the global

2740 Economic and Political Week. October 5, 1996

processes and is therefore, basic. Hence the claim that it has informed both the development strategy and the role and methodology of planning. As for the former it is a major shift from a statist perspective which gave a relatively greater weightage to the endogenous factors (and were to an extent irksome to the external forces) to an open and outright corporatist perspective with pronounced prominence of the exogenous factors. This became possible on the basis of an understandable broad measure of support from the indigenous major corporate players, who acclaim these changes as a paradigm shift from dirigisme to market friendly neo liberalism. As a result, the role and methodology of planning, it is stried have also to undergo a major transformation The redefinition of the development strategy regime has been described as liberalisation new economic policy economic reforms structural adjustment etc. The planning system under the market friendly globalised privatisation and deregulated policy regime with greater fiscal discipline has been des cribed as indicative flexible, integrative frame work planning etc (Lighth Plan Vol I force word Preface and Chapter I 111 to 116)

Thus the Fighth Plan puts forward the claim that it is an explicit change over to indicative planning. It is not clear what it is intended to mean. Is it a plan in which the targets for the private sector are not compulsory and binding but are systematic and consistent macro and sectoral forecasts to the realisation of which public policies and plans are likely to contribute or are to be made to contribute? Alternatively is indicative planning taken to mean a situation in which no sectoral targets are prescribed particularly for the private sector? In that case the plan would be confined basically to the creation of conditions and incentives and sanctions or disincentives likely to contribute to the realisation of the plantargets, which are basically guestimates. It raises a further question did we ever have firm comprehensive and systematic plaining for the attainment or overall and sectoral targets especially for the private and the informal sectors. It has been maintained that in India 'although economic planning is not very comprehensive and the role of private initiative in generating employment and income is predominant yet the Plans particularly the National Five Year Plans provide direction to and to a rarge extent control the momentum of economic activities" [Ministry of Labour 1991 B 5] Despite such claims it is open to question whether even the public sector targets were supported by firm budget allocations in real terms and with demonstrated physical feasibility and managerial capabilities in a clear time-frame. And what about the availability of foreign exchange earned

borrowed or invested, for meeting the plan tasks and the terms on which the availability is ensured? Were macro-economic short and medium term policies, adequate, consistent and derived from the plan? Let alone the constancy and implementability of our presumed multi-level plans, were even the macro-projections more than mere econometric exercises? Did the plan explore the methods of their realisation particularly in view of the separation of planning and budgeting and with the latter being the dominant operational critity?

With the liberalised policy regime giving freet hand to market forces, both domestic and global, and carrying our extensive deregulation (and not just debuteaucratisation which in fact seems to be faltering) as a datum and preceding and overarching the plan what are the policy instruments still available to the planners? With fuller play being granted to national and international market forces, what are the instruments of intervention available to the planners for realising the plan which replace and/or strengthen the ineffective or counter productive tried so far. In order to be able to make sense of the proposition regarding a switch over to indicative planning one would have to grapple with the questions of the kind raised above

The Lighth Plan recognises at the very outset that it is being launched at a time of momentous changes in the worldeconomy and in India. It avers that All over the world centralised economics of several regions he getting integrated under a common philosophy of growth, guided by the market forces and liberal policies (1 1 6 2) I ven in the ideological sphere it is maintained that several distinguishing philosophies of the 20th century have been swept away and hence in the light of the development experience of our own and others we must make appropriate mid course corrections and adjustments as we cannot remain untouched by these trends (Idem) As is the wont. Indian plans rarely take any categorical stand and always interlace their positions with caveats and qualifications, there are some muted refer ences to 'our basic policies' which have stood us in very good stead but nonetheless "in this turbulent world" our policies must also deal with changing realities" (Fore word) Indicating the direction of this adjustment to changing realities it is stated that. The emphasis is on autonomy and efficiency induced by competition (i.1 6.2)

In a plural electoral democracy like that of India obvious constraints are faced in making drastic departures from policies which enjoyed wide support and respectability and are with our any decisive repudiation at empirical and theoretical levels. It is in this context that references

to the dramatic collapse of the Soviet Union and eastern Europe come handy in advocating a case for a change of the course. This is often buttressed by trumpeting the 'miracles' in east Asia, which is often based on halfbaked analyses, high selectivity of indices and is generally context free and one-sided ( Does Planning Commission have a New Role" Business Line, May 30, 1914) One can easily hear in such positions the cchoes of the triumphalism of the end of history variety, a la fukuyama. One need hardly refer to the premature character of such pronouncements concerning eastern Europe and the Soviet Union as the recent economic crises and political developments there are tending to indicate

On account of the inability of the development strategy to deliver the promised good planning tended to cyoke widespread disenchantment. The failures of the development strategy thus adversely affected the credibility of planning though there is no necessary one-to-one relationship between particular development strategy and the practice of planning. The limitations of the development strategy are due to a large number of factors and forces with the particular form in which planning was done being just one of several factors. The emergence of powerful forces in our midst like the persistent power and influence of India's business and bureaucratic clite the near unrivalled and unchallenged begemonic position acquired by the G-7 countries and the Brettonwoods twins and the MNC lobbies the unbriddled economism of the trade unions the marginalisation of the marginalised informal sector etc. too would not have made a net positive contribution either to the success of the development strategy or to the effectiveness of planning These traits and influences became too strong and arresistable by end 1980s at least by the forces from within

Gradual and steady chipping away of the discipling and regours of planning have been going on at least since the mid-1960s, if not earlier. Thus what has culminated in the 1990s and with the Fighth Plan is neither sudden nor entirely new. It seems to have been building up for quite some time Even then the changes proposed in the Eighth Plan are not without cavcats equivocation, (deliberate?) and confusion which have generally marked out the real policy goals, instruments and processes from the stated ones. Thus one can see references to limitations of the market and consequently a statement that 'It is thus not a choice between the marked mechanism and planning' the challenge is to effectively dovetail the two so that they are complementary to each other (Foreword)

This undoubtedly sensible and perhaps the only realistic, realisable possibility may,

in practice, mean various things, unless the respective spheres of the market and planning are clearly specified and the crucial question of their interaction and relative preponderance are clearly and operationally defined. While a number of statements have been made to spell out the new role of planning, their mutual compatibility and real, effective thrust remain clouded (as we try to bring out) under a good deal of facile verbiage.

For instance, it has been held that, "It is a plan for managing the change, for managing the transition from centrally planned economy to market-led economy without tearing our socio-cultural fabric" (i, Preface). As a part of this exercise, the public sector has to give up "such activities which are not essential to its role" (i). In this process "from, a highly centralised planning system, we are gradually moving towards indicative planning "concentrating on "building a longterm strategic vision of the future", setting forth "the priorities for the nation" The hallmark of the indicative planning is that it "goes into the details, examining the alternatives and identifying the various projects" in the public sector, and "for the rest of the economy it works out sectoral targets and tends to provide promotional stimulus to the economy to grow in the desired direction " (ii, Preface). Since the plan has " to concentrate on anticipating future trends and evolve integrated strategies" (1), its role has to change. "In place of the resource allocation role which very largely characterised the working of the Planning Commission in the past, it will have to concentrate on optimum utilisations of the limited available resources'. But confusion and the desire to appear differently in different contexts make the planners also go on to assert that "In addition to the resource allocation role, the Planning Commission will concern itself with resource mobilisation for development as well as with efficient utilisation of the funds" (ii; Preface).

It is apparent from the foregoing that either there is a crisis of identity facing the Commission, or it is simply confused about its role and methodology. The use of the terms like 'optimum' and 'efficient' further underscores the less than scientific character of the formulations. With a massive private and unorganised sector (subject to tenuous and ex post regulation and licensing of the large private investment proposals but without ex ante attempt to direct and facilitate private investments in desirable channels like in Japan and South Korea with their practice of 'administrative guidance'. 'reciprocal responsiveness' and policy councils) and with the virtual independence and clear organisational separation of budgeting from planning, both at the level of the union and state governments (resulting in large and random divergence between the planned and actual public investment and a randomly obtained pattern of financing) and without any attempt to plan critical variables like relative prices and price level, income and wealth distribution, with critical dependence on external funding which makes us submit our overwhelmingly indigenously financed plans for endorsement to the Aid India Consortium in order to obtain marginal magnitude of external funding, it is facile and naive to claim to have operated a centrally planned economy, from which a transition to indicative planning is being attempted. Oucerly, as we see below, the Eighth Plan itself disclaims that India has ever had a brush with centralised, comprehensive planning. One wonder if even a proper indicative plan, in the sense of a consistent forecasting framework for major investment projects and a plan embodying a shared perspective between the private and public sectors has operated in India at any point of time. After all, planning is quite a different matter from putting together a plan document and giving some peripheral role to the agencies entrusted with planning [Seers 1972]. Thus the changes in the nature, role and methodology of planning which the Eighth Plan is supposed to accomplish is rooted in a confused, imprecise and unsustainable claims about what has been happening in these respects so far.

Even what is indicated in the Eighth Plan regarding micro-level participatory planning is rather pale and jejune attempt at operationalisation of a multilevel planning system, as can be seen from the following statement in the plan itself. "It is proposed to launch the experiment of micro-level participatory planning in 150 blocks during the first year of the Eighth Plan through the creation of a three-tier institutional system... The organisational structure has already been worked out and during the first year of the plan we intend to start pilot projects in 150 blocks. Depending upon the results, the experiment will be extended to 500 blocks during the Eight Plan period" (viii, Preface, emphasis ours). Thus after over four-anda-half decades of development planning, a subcontinental national economy with vast differentiation and diversity is going now to experiment with participatory micro-level planning as a pilot project in 150 of the nearly 5,000 blocks, of which nearly onetenth are to be covered during the plan period if the initial results are encouraging. One can see how micro-level planning is also reduced to a project, when even accepted conventional wisdom too suggests that without integrated multi-level planning, we cannot have effective and meaningful development planning in a country like India.

The above factors and caveats put a serious question mark on the proposition regarding a change, a shift in the plan methodology

from centralised resource allocation planning to indicative, flexible, integrative, framework planning. Then, what does one make of the changed global context, the claim of learning from our own and other's development experience, severe resource crunch, the difficult external payments situation, mounting debt burden, consequent opening up, and the commitment to 'start rolling back the public sector'? It is clear that the Eighth Plan is different from the preceding plans, (though, as seen above, one finds parallels in the Fourth Plan), insofar as the policy regime has been drastically changed under as comprehensive a policy package as the structural adjustment programme, with major changes in the trade, fiscal, industrial, financial policies, with large-scale opening up of the economy. All these are taken as the 'givens' of the situation by the plan formulators. Thus development planning does acquire a changed character. But what kind of character?

It is our contention that this change is basically an openly declared change in the content of development planning. It means recognising that the purposes, priorities, agents, instruments and processes of growth of the economy have been changed in a market-friendly, externally-oriented direction. These things which were not so openly acknowledged earlier and, even in practice, were, to an extent, qualified are now presented as 'reforms'. This is because the new industrial, investment, trade, fiscal and BOP stabilisation policies have substantially reduced the role of the state and planning in setting the pace and determining the direction of growth. A paper by the Perspective Planning Division (PPD) of the Planning Commission has described the shift of development strategy as one to an "open economy industrial development" as "once again neoclassical doctrine (has) regained its theoretical hegemony resulting in exportoriented trade policies" [see Business Line, May 30, 1994]. One wonders if 'hegemony' is treated as the equivalent of either validity or relevance. The Mahalanobis model of industrial growth, investment allocation and the consequential trade policy have been bid goodbye. The PPD paper mentioned above, makes the point clear when it says, "Indian planning and policy started responding to the liberalisation wave from the beginning of the 1980s but it was largely confined to the domestic sector. It was at the beginning of the Eighth Plan that a fuller response to 'economic reforms' was affected".

How does the role of planning change under the dispensation of externally-oriented reforms? The same PPD paper attempts an answer "The Eighth Five-Year Plan stipulated that in view of the need to build massive infrastructure, existence if significant number of poor underprivileged, existence of severe

imbalances in the course of development, government will have to play a role and step in for creation of supply of essential inputs like power and creation of infrastructure where private initiative is not adequate. It will have to continue to run programmes for the future and the weaker section. Programmes for social welfare, population control, environmental protection, health and education, at least at the primary level, will continue to be the responsibility of the government for quite some time to come." Obviously the continued role of the state in various spheres does not by itself change the role, character and methodology planning. as no one-to-one relationship between what and what to plan for, and how to plan per se can be found. The PPD clarifies that the responsibility of the government in implementing programmes and projects for development will have to be qualified in the sense of limiting it to areas of infrastructure and social investment and only in areas where private initiative is still inhibited (see Business Line, May 30, 1994]. One can see how a contingent relationship between the role of the state in the economy and the role of planning has been taken as a necessary, inexorable relationship. Since markets as they exist may not be equal to the new and daunting tasks, the planners also visualise for themselves a role to help the market expand and make it work more freely, competitively, with accessibility to the small, and the regulation of monopolies. In general, the attempt would be to create enabling conditions and a framework of macroeconomic population estimates, in which "analysis of investment behaviour will be at the core of the new modelling effort".

For this kind of planning, one needs a great deal of accurate, up-to-date and actionable business information on the one hand, and sectoral, regional and national aggregate current information and consistent forecasts on the other. While the plans need such data, they are also generators of such estimates so that the private decision-makers and different public agencies prepare harmonious, consistent projects. Hitherto Indian plans have not gone far in these directions, unlike, e.g., the Japanese, where consultative, participative processes are used for preparing a 'vision' to be embodied in the plan [Kabra 1995].

None of these changes in the development and economic policies by themselves alter the methodology and nature of planning. The latter can be changed in many diverse ways, but the prevailing methodology (as distinct from its characterisation as comprehensive, centralised and command planning) is not *ipso facto* incompatible with the changed policy regime. It is arguably consistent with the prevalent planning methodology, which leaves considerable role

for the market processes. This is not to say that there is no need for strengthening and improving it in many diverse ways. It has to devise and improve methods of harmonious working with the market agents in general national interest. The agenda of the plans has been undergoing changes but not the method of going about it in any marked manner [Mozoomdar 1994]. This is mainly because even the former agenda and growth strategy were operated without centralised, comprehensive planning; now with greater role for the market and external forces, and the consequent downgrading of the social content little compulsion to move away directionally, from the trodden path is likely to come into play. One does not have to go far to seek ex cathedra support for this position. Here is what the Eighth Plan has to say in the course of specific discussion of the role of planning, "The centralised planning of the type practised in socialist economies did not exist in India. ever. In practice, the market has determined allocations in a major segment of the economy" (1.5.2:18). The Eighth Plan goes on to say on the same page a little later, "so far, resource allocation has been the predominant role of the Planning Commission" (1.5-4:18). On the most charitable interpretation, it may possibly mean that in the non-major segments where the market does not allocate resources, at least with a free hand, the Planning Commission may well be discharging this responsibility as its major activity. Obviously, for the economy as a whole, the planners' allocative role is limited, even with respect to public outlays as it was divided between the union and the states; the fiscal and monetary policies largely outside the control of the planners too reduce the element of planning, the essential point, however, is that prior to the Eighth Plan, we had no centralised planning and what obtained a best was weak, poorly co-ordinated, uncertain public investment planning with some minor similarity with frenchstyle indicative planning (Commissariat General Du Plan, nd).

However, the practices and methods adopted so far could not become an effective means of ensuring planned behaviour of the public investment component of the economy. An important factor which weakened the planned element vis-a-vis the elemental, spontaneous and random ones was the near divorce of planning from current economic management. As a direct participant and perceptive analyst of Indian planning has pointed out, "The Resolution setting up the Planning Commission had one serious lacuna which was not then realised. There was no reference to the Commission's possible role in relation to the working of the economy. This was due to failure to appreciate adequately the relationship between planning and the operation and management of the economy... later events brought about some measure of co-ordination between planning and current economic policy although the relationship has remained largely undefined as the *Planning Commission has remained essentially on the sidelines of current economic policy*" [Singh 1979:5; emphasis added).

The Commission, concerned with the longterm growth and evolution of the economy. was kept out of the management of the economy in the medium- and short-run. The latter charge was entrusted to the market forces and to agencies like the union finance ministry, the Reserve Bank of India and man other economic ministries of the union and state governments, without the creation of a co-ordinated policy-formulation agency or a mechanism for the purpose. As a result, resources mobilisation moved out of the purview of planning and as corollary even investment planning could not become really effective. This is a factor essentially related to the organisational and operational separation of planning from budgeting, which in actual practice becomes at times acrimonious and adversial, e g, as reflected in the differences between the Planning Commission and the finance ministry over the mid-term appraisal of the Eighth Plan. In any case, the exercise to mobilise additional resources, ffscal, monetary, credit and foreign exchange policies, non-plan transfers to the states, capital market policies and regulation, agricultural, industrial and labour policies, etc, remain out of the purview and control of the planners at an operational level; generally, the planners have to adjust to these changes ex post. What was described as "planning without a policy frame" during the mid-1960s unfortunately remains valid even up to the present [Gadgil 1967]. With a large and growing non-public sphere, the methods of intermeshing plan perspective with that of the private entities do not seem to have received attention in term of policies, regulatory mechanisms and reciprocal responsiveness to schemes of indirect steering. Thus there came about a sharp cleavage between the long-term growth policies and programmes (supposed to be under the charge of the Planning Commission) and the short- and mediumterm economic and social policies (divided among various union ministries and state governments without being brought under a common umbrella.)

This is in addition to the sharp differences between the private corporate sector's priorities and behaviour patterns, and what the plans and public policies wanted to obtain from them by means of a number of regulations, controls and promotional measures, particularly in terms of thrust industries, preferred technologies and locations. How

this lack of harmony and shared perspective made the planners' controls and regulations an anathema to the organised big business and how these discretionary, multi-goal, unco-ordinated, generally ad hoc bureaucratic controls distorted the economy and generated huge rents of authority and a thriving unclean, underground economy are too well known to require any recapitulation [Myrdal 1968; GOI 1985; Kabra 1982].

What seems to follow from the foregoing is that the Eighth Plan marks a change, rather a far-going transformation, of the policy regime, which formalises, carries forward and openly puts the seal of approval on a number of halting, unannounced series of policy changes spread over a long period. These changes would go towards redefining the policy outcomes and hence may be taken to constitute a serious rewriting of the content of India's development strategy. What is to be achieved by India's development planning and, the agencies and instruments pressed in the service of these goals have undergone a dramatic change. This is what we mean when we maintain that the content of India's development strategy has been changed. The public sector has now been given basically an instrumental role and public investment would have to play second fiddle to private. basically corporate and foreign investment. Instead of meaningful and effective planning, "getting the prices right", i.e. following the signals from market prices seems to be the chosen path. Thus the policy-framework and choices would not follow from the plan. On the contrary, the FISSAP has been taken as a given in step with the forces operating globally. Probably this is a recognition of the decisive influence the conditionalities of the World Bank-IMF exercise on India's policy regime.

The Eighth Plan, which in a competitive, plural electoral democracy, has to maintain a certain degree of continuity with at least the hallowed policy postulates of the past has little option but to reiterate a string of objectives the plan is supposed to achieve. But it has also to reckon with the reality of the new policy framework which gives a clear edge to the large organised capital irrespective of its national origins in the functioning of the economy and cornering of its goodies. Hence, for the first time, we find that in the section specifying the plan objectives (9,10), a 'four-fold focus' takes precedence over the usual homilies presented as plan objectives. The very first point of his four-fold focus, as seen earlier, reiterates the essence of the structural adjustment programme. We can thus conclude that the content of development planning, through a series of incremental changes, has crossed, during the Eighth Plan period, the threshold to qualify as a distinct change in the content

of development planning; what the plan sets out to attain and its method of attainment.

But this change and the resulting downsizing of the state's economic role don't signify a change in the methodology of planning, viz, how the plans formulated in its various aspects and during the various phases of the planning process. This is because the prevalent methodology is generally market-oriented in our mixed economy, federal polity and non-plan oriented bureaucracy. It is ready, with some changes to cope with the new development strategy and policy. The plan did not mandatorily cover the entire economy and did not specify mandatory commands in the fashion of centralised, comprehensive national planning at any stage since its inception. With the informal sector as the biggest component of the economy, no such thing can even be visualised. It is not, however, implied that this is necessarily any weakness of Indian planning. It did not happen, despite our centralistic federalism, that the planners took all or the major decision about public investments which were handed down in a top-down style to various executive agencies. However, the public investment decision regarding the programmes and projects, of various ministries, public enterprises and the state governments did come to the Planning Commission for final approval. There is a similarity between the above procedure and the licensing of private projects. The essential point is that planning is greatly different from approval/ disapproval. As a result the estimates and targets set by the planners had a rather large soft content. It would have to be considered a surprise and a coincidence if any of its targets and estimates came out to be realised in toto quantitatively, temporally and in terms of cost. The two plans during the 1980s had, what one may say, the dubious distinction of realising the overall growth target. But how this 'lost decade' queered the pitch can best be gauged by the fact that it left us with an impasse which the successor authorities described as the most serious since independence and became the immediate factor leading to the rewriting of the development strategy, in terms of the acceptance of the SAP fathered by the Brettonwood twins.

It is true that with greater marketisation, opening up and deregulation, the uncertainty causing factors would acquire still greater salience. The economy and the plan would be buffeted by many more factors than perhaps was the case hitherto. But the plan methodology does not change in the sense that what we had (to put it in the simplest terms) was projection of outlays (financial) and targets (physical) bases on possibilities of resource availabilities including additional resource mobilisation and a broad examination of intersectoral consistency of physical programmes and targets. Obviously all this depended on a number of assumptions, data availability and estimates. As we started inheriting a backlog of incomplete projects, with cost and time runs over, the spill-over projects reduced the prospects for fresh projects. This difficulty was further compounded by the growing fiscal crisis of the state, which manifested itself in growing negative balances from current revenue and mounting fiscal deficit. The choice space of the planners was consequently narrowed

 World Bank Style Welfarism?

Despite the rhetoric of centralised planning, the unplanned market forces, both domestic and external, continued to do short work of many of the plan projections. An examination of divergence between budget estimates, revised estimates and actual figures [Minhas 1989] clearly shows that the elemental market forces had a clear edge over the teleological, planned, proactive forces. To use the categories popularised by Russel Ackoff in the context of planning, Indian plans contained elements of inactivism, reactivism and preactivism in varying proportions in various sectors and during different plan periods but elements of proactivism and interactivism remain considerable weak. Thus it is clear that the nature of Indian planning was not centralised. comprehensive planning intent on directing and governing the markets and the market operators and forces. It tried to make some intelligent forecasts, adopt some macrosocial objectives and, by and large, operate within the given institutional framework with some not-so-successful attempts at some institutional changes and organisational innovations. The claims of these who are suggesting that a change from 'directive' to 'indicative' planning has come about with the Eighth Plan are not doing proper justice to the planning methods adopted prior to the present plan and one may even say, their characterisation is largely a misrepresentation. Hence the thesis of a changed methodology of planning loses its sheet-

It may well be asked: what are the results one can expect from the marriage of the old, prevalent but now openly acknowledge indicative, non-centralised, weak and nondirective planning, (which essentially makes a none-too-large co-ordinated and effective intervention to overcome known limitations of the market mechanism while it hardly devises any effective response to the contingent and essential limitations and pitfalls of government and bureaucratic interventions with enlarged, opened up and further empowered (unhindered) market mechanism based 'development' and economic management policies? In other words, now that the short- and medium-term economic management under the control of the ministry of finance working in close cooperation with (if not, as is maintaining by some, under the dictates and surveillance of) the World Bank and the IMF have acquired more voice than the long-term development policies worked out by the Planning Commission, what does one expect regarding the emerging model of the functioning of the economy? Would planning be able to maintain its present none-too-strong and viable position? This factor, howsoever important, cannot by itself be decisive in determining the performance of the economy.

Nonetheless, it is likely to reduce the friction at an operational, day-to-day level between several public entities concerned with the economy. The long-term perspective is likely to get comparatively dimmer as the current concern with FISSAP acquires an upper hand. This may get reflected in the finance ministry pressing for carrying our the Fund-Bank agenda, e g, reduction of food and fertiliser subsidies, formal acceptance of exit policies, privatisation of sick PSUs, financial sector 'reforms', etc. (which have the support of organisations like the CII, ASSOCHAM and other business organi-sations and some political parties), while the planners would make some noise about the level, pattern and spread of public investment and strengthening of the social safety net. Since major policies and resource mobili-sation would continue to remain under the control of the finance ministry, the planning would further weaken and, short of formal renunciation (which may not be liked even by the Aid India Consortium since the commitment of resources to be 'transferred' by them requires a mediumterm plan), would simply limp along Since infrastructure sector is also being offered to private investors and the union and state governments are bending over backwards to lure in (with conditions like sovereign guarantees and assured level of returns) foreign investors, even in this area the role of planning may become weaker and

Most significant are likely to be the results of the greater opening up of the Indian economy by a host of policy measures concerning trade, industry, foreign exchange rates, investment, capital market, technology, etc, particularly after joining the WTO. This process of unbridled globalisation is bound to weaken the role of the endogenous factors To this extent, planners may at best remain content with preparing alternative scenarios based on different sets of assumptions regarding the nature of changes in the economics of the OECD (since globalisation is basically concerned with increasing dovetailing of our economy with the OECD economies as the South-South co-operation ranks rather low in the present priorities) and the manner in which these cross-currents would reach the Indian shores. Thus the new dispensation would accentuate our externally-induced vulnerability. The planning process would have to trail behind the market processes and the external forces to a much greater extent than was the case prior to the Eighth Plan. As can be seen, these are the effects flowing basically from the changes in the policy regime, and the content of development planning towards FISSAP. The planning process is basically made to respond passively to these influences. This would render planning even more of an empty box than has been the case so far. Liberalisation may not consciously plan for a changed role, relevance and methodology of planning but it amounts to a change in the strategy of development planning which is by and large in harmony with the prevalent essentials of the planning process as they have evolved incrementally over the years.

## **Urban Development in a Colonial Situation**

## **Early Nineteenth Century Bombay**

#### Amar Farooqui

Opium provided the Bombay hourgeoisie an important source of accumulation. This accumulation together with the capital which had become available through a strong indigenous presence in the commercial activity of western and central India could be channelised into industrial development at Bombay. This had its impact on urban development. From an urban sociological perspective Bombay is representative not so much of a colonial city with its colonial/indigenous spatial dualism but is an easily recognisable capitalist city with class differentiation determining its spatial pattern.

T

OVERWHELMED by the collective nostalgia of a people over whose empire once upon a time the sun never set, some popular works on Bombay revel in selective images of the city, choosing such landmarks and such moments in its history as might conjure pleasant memories for those who look back on the days of the British raj with longing.1 While there might not seem to be much harm in such nostalgic evocations, one has to guard against the distortions that could be, and often are, introduced by allowing a desire for some of the aesthetically more appealing experiences of that era to become a desire for the days of the raj. Further, one must be careful that the ugly is not easily ignored. Howevermuch one might like to suggest that learning to play cricket and thinking "more or less in the European manner", gave to indigenous groups the wherewithal to participate in the economic development of Bombay on more or less equal terms with the British, and that this co-operation was responsible for the success story of Bombay,2 the fact remains that the destiny of Bombay as a great commercial and industrial centre was born of its becoming an accomplice in the drugging of countless Chinese with opium, a venture in which the Indian business class showed great zeal alongside the British. This is the sordid underside of Bombay's colonial past.

Towards the end of the 18th century Bombay, having been drawn into the vortex of capitalist relations, was assigned its role in the world capitalist system. Through colonial manipulation Bombay was made the main spatial regulator, in western and central India, for the transfer of tribute to the metropolis. In the process the hegemony of capitalism was fomented in the city. In the case of an advanced capitalist country like Britain establishing a colonial relationship with regions in which the capitalist mode of production is not sufficiently developed, or not dominant, the problem of transition to capitalism is complicated by the fact that the colonial power seeks to create a mechanism for tribute realisation which as loot/plunder/drugtrafficking may form a part of the prehistory of capitalism. To thus differentiate precisely between that aspect of the development of the colony which is strictly a part of this prehistory and that which constitutes the integration of the colony into the world capitalist system is not very easy.

The point is that colonial powers tried to subvert market relations whenever faced with stiff competition from the nascent bourgeoisie of the colony. It was not by superior business organisation but through extra economic intervention that indigenous competition was overcome. It has at times been suggested that the European East India companies represented a new type of business organisation in Asia. Decisions relating to a wide range of activities were taken centrally by these companies. K N Chaudhuri in his magnum opus, The Trading World of Asia and the East India Company (1978), considers the centralisation of the decision making process an important reason for the success of European companies in Asian

The unique quality of English and Dutch trade with Asia, as conducted through joint stock companies, sprang from the attempt to impose a centralised and bureaucratically directed system of exchange and distribution on markets that were traditionally decentralised, fragmented and oriented towards individual efforts.<sup>3</sup>

As a management strategy centralisation had its uses particularly when markets were widely separated. But it was colonial political intervention that gave an edge to the English, as indeed the Dutch, East India Company.

The rise of capitalism is marked by commodity production and the end of production for mere simple consumption. In the colonial context, the possibilities generated by production for exchange, production for the market, remain unrealised – blocked – in the absence of sufficient regular avenues for normal capitalist development. Intervention by the centre usually forces colonial surpluses out of the colony for appropriation by the centre or into wasteful (in a strictly capitalist sense) expenditure/consumption. Normal

capitalist development in the periphery is neither the intended objective nor the end result of colonial intervention. Hegemony for tribute realisation is the major aim. This hegemony and the plunder that it permits makes it difficult for capitalist development in a colony to be along the same lines as in the metropolis for 'if this were so, then despite the different starting point the end would be the same as at the centre'. \( \)

In the early 19th century Bombay was fast acquiring an easily recognisable capitalistface. The city was well maintained in parts, it was squalid and congested in others. Population was expanding; there was growing functional specialisation and division of labour; relations of the market were penetrating day-to-day life; and class differentiation was cruelly apparent. Right at the outset it is necessary to point out that urban development cannot be understood without reference to a specific social formation. To view the urban development of 19th century Bombay without placing it within the wider framework of the development of capitalism and the intervention of colonialism would be a mistake. It goes without saying that colonial rulers brought to urban development in India certain features which were inherited from the historical evolution of cities in the metropolis.4 At the same time it has to be borne in mind that such features were inescapable insofar as colonial rule drew various urban centres in India into a network of capitalist relations. Indian cities on which the British left their imprint became less or more capitalist cities depending upon the extent to which capitalism was able to develop/not develop in them or in the region/s in which they were located.

In Bombay, just as in Calcutta, Madras, Simla, Ootacamund, etc, a pre-colonial city did not lie heavy on the colonial city. The organisation of space in colonial Bombay was therefore unencumbered by predetermined usage. In Delhi, Lucknow, Ahmedabad, Pune and other cities with a pre-colonial past the pattern of colonial urban development had to take into account space which had already been historically

appropriated.<sup>5</sup> It was often difficult to internally modify the usage of this space to suit colonial requirements: the colonial city had to be located externally. The example of Delhi is instructive. Here colonial rulers created two 'external' cities, at different points of time. One was in the middle of the 19th century, especially after 1857-58, when the area outside Kashmiri Gate was developed as an exclusively British 'civil lines'. Beyond the 'civil lines', troops were quartered near the Ridge. This was the time when a belligerent Delhi was being subdued after the 1857 Revolt. Before 1857 also, however, the British had shown a preference for the area lying north of Lal Qila. The residency, St. James' Church, Ludlow Castle, Metcalfe House, etc, were all located in this direction. There appears to have been no radical departure after 1857-58, except that now the 'civil lines' was situated outside the walled city more completely. During the latter half of the 19th century 'urban Delhi conformed to the classical model of 'native city'. cantonment and "civil station",6 so characteristic of the colonial urban tradition in towns with a pre-colonial history Then, after the decision to transfer the capital of British India from Calcutta to Delhi in 1911, a new external city was built, this time on a grand scale, on the southern outskirts of the old city. Raisina village was to house symbols of occidental despotism and ample space intervened between the new city and the old.7 The one did not easily impinge upon the other and the ivory tower feeling of the viceregal residence was complete.

In those cities which evolved largely as a result of British initiative, colonial urban development did not merely have to be the other of indigenous settlement. As there had been no initial appropriation of space in these cities, it was possible for the colonial rulers to take up the most favourable locations which then became the nucleus and raison d'etre of the city as a whole. Here too it would be inaccurate to talk of a uniform pattern. In the major colonial port cities, Calcutta, Madras and Bombay, where defence against external enemies had mitially been an important consideration," a fortified European settlement became the starting point of development. In these cities, however, a live economic and administrative contact with various indigenous groups was vital for the East India Company. Hence it was not feasible that the non-indigenous part of the city be completely detached and separate, permitting no interaction. Indigenous groups had to be allowed some access to a few prime locations either within or in the vicinity of the fort area. In hillstations where the British did not look forward to any intercourse with the 'natives'. and which had been built at a time when British rule was relatively secure, far greater

freedom in creating a non-indigenous environment was possible.<sup>9</sup>

There is, therefore, no such thing as colonial urban development in the abstract. Various urban centres were products of specific historical conjunctures. The sanatoria apart, for strictly speaking their historical role was very limited, urban centres of colonial India reflected variations in the level of capitalist development in different parts of the country. Spatial organisation therein was indicative of the relative strength or weakness of indigenous groups and their capacity to intervene in the control of urban space. The urban development of Bombay has to be seen in this context.

Here one might draw attention to the distorted nature of urban development which colonial rule set in motion. Urban centres developed or patronised by the metropolis in colonies often failed to generate economic activity concomitant with their expansion, since much of this expansion was often not the result of an organic growth but was related to specific colonial economic/ military/administrative/strategic/political considerations. The hegemony of the colonial power placed it in a position to intervene arbitrarily in according primacy to a particular urban centre in a given region so that frequently artificial, imposed and unintegrated urban development took place.

#### BOMBAY: A BRITISH CREATION

Bombay as an urban centre is a British creation. It does not have much of a precolonial past. The subsequent greatness of the city should not tempt us to think in terms of the inevitability of its rise. True, Bombay possesses from the safety of its port a distinct advantage which was crucial to its emergence as a major commercial centre.10 However. Bombay has not always been very easily accessible from the surrounding parts of western and central India. For one, the Sahyadri mountains act as a barrier between the coast and the Deccan tableland.11 The relative inaccessibility of Bombay from western and central India was reflected in its peripheral position in the context of the commercial network of the area well into the 19th century. In the middle of the 19th century when a railway network for western and central India with Bombay as its focal point was being contemplated, attention was drawn to the fact that the country to be traversed in going from western and central India to Bombay was "intersected by no navigable stream" and did not have "any of the facilities which good roads afford";12 and dwelling on some of the drawbacks of the city's position, the Bombay Times and Journal of Commerce (July 10, 1840) noted in one of its issues that "Bombay unlike Calcutta, is not situated on the estuary of a hundred rivers, and that its less favoured inhabitants have no rich alluvial plains like those watered by the Ganges, nor roads such as they have in Bengal".<sup>43</sup>

While the favourable situation of Bombay along the western coast equipped it for its development as a port, the geographical relationship of Bombay with western (and central) India was not a very close one. Few overland trade routes were directed towards Bombay. In fact down to the 18th century the main overland routes linking northern and central India with the Arabian sea terminated almost 300 km north of Bombay. The Gulf of Cambay was the main catchment area for goods flowing towards the west coast for overseas shipment.14 Cambay, Bharuch, Jambusar, Daman and Diu, and above all Surat, were the destinations of caravans arriving from Agra, Ahmadabad, Burhanpur, Navsari. Sironj, Ujjain, etc 15 A minor route, running south of Surat, stopped short of Bombay at Bassein. 16 On the Konkan coast, Chaul, Dabhol and Venguria supplied. merchandise to Surat but the trade remained essentially coastal.17 the Konkan even today being relatively inaccessible by overland transport. To the east of Bombay, the western ghats prevented the interior of Maharashtra from being easily converted into a hinterland for Bombay. Consequently, Bombay was only a getting-off point for coastal trade and not a destination for overland routes. The insularity of Bombay was completed by (a) the fact that it was an island that was not adequately integrated with the mainland, and (b) possession by the Marathas, till the 1770s, of Bombay's large northern neighbour, Salsette.

Bombay was dependent on sea-borne trade even for its basic necessities. This contributed to enhancing the extrovert character of Bombay's economy from the time of British occupation. When Bombay came into the company's possession only a small portion of the island was in a state of cultivation. In John Burnell, writing during the first decade of the 18th century made the following observation about the supply of food to the island:

Cows are a scarce commodity on the Island, as in truth is every thing else of provision, we being beholden to our neighbours the Portugueze(sic) for almost every thing that we cat; otherwise we might starve, were we only to subsist on the production of the Island.

Though in decline, the Portuguese presence on the west coast was still quite visible in the early 18th century as is indicated by, among other things, 'the role of the Portuguese language as the lingua franca of all commercial intercourse in which Europeans took part'. What is significant is that Bombay's reliance on the residual commerce of the Portuguese for providing

its inhabitants with articles of subsistence underscored the island's coastal and hence extrovert nature.

Moreover, the unassailable position of Surat as a major centre of foreign trade along with western coast of India for most of the 17th and part of the 18th century precluded the possibility of fully utilising the potential of Bombay even though the British were in possession of the island since the middle of the 17th century.21 Yet, the dectine of Surat by the middle of the 18th century did not immediately open up opportunities for Bombay. As a matter of fact the transformation of the city into a major urban centre was slow and arduous. It is necessary to stand back a little and locate the problems of Bombay within the larger picture of western India rather than view them within the limited context of Bombay/Surat alone.

It would not be sufficient to talk in terms of the competition offered by Surat since the decline of Surat did not, and could not, by itself be the starting point of Bombay's rise. The factors leading to the decline of Surat were, after all, not specific to that city alone. They influenced the trade and economy of the north-western coast of India in general. Ashin Das Gupta's masterly study of the circumstances which led to a reversal in the fortunes of Surat has shifted the focus from reasons like the silting of river Tapti (on which Surat is situated), or the sack of the city by Shivaji in 1664 and 1670, often suggested to explain its decline. Das Gupta has argued that the decline of the city was the result of a particular conjuncture: the almost simultaneous waning of three great empires which had contributed to the immense prosperity of Surat in the first place - the Mughal empire in India, the Safavid empire in Persia and the Ottoman empire in the near east.22 The Red Sea and the Persian Gulf had become increasingly important for Surat merchants. The weakening of Safavitland Ottoman authority disrupted Surat's trade with West Asia. More crucial was the decline of the Mughals during the early 18th century.

Das Gupta has drawn attention to the adverse impact of the instability of the opening years of the 18th century on the economic activity of western India, and of Gujarat in particular. Political upheavals of the period brought to an end 'Mughal peace' and led to tremendous insecurity. Long-distance overland trade links which had given Surat access to distant centres like Agra, Lahore, Banaras, etc.<sup>23</sup> were suddenly broken.

The large canvas within which Das Gupta has placed the decline of Surat allows us to see this phenomenon as one that was part of a general crisis in western Indian trade. If Surat, around which the economic life of the north-western coast of India had revolved,

failed to survive, could Bombay, with its peripheral geographical and economic position, be expected to make a sudden impact?<sup>24</sup>

Bombay's coastal trade, which was largely in English hands, was also facing problems arising out of a shift during the first half of the 18th century in the focus of English commercial activities in India from the west to the east; to Madras and thence to Calcutta.25 By the 1740s while there was on the one hand an increase in Bengal's Europe trade, with piece-goods, raw silk and saltpetre as the main commodities, on the other hand there was a downward trend in the Europe trade of Bombay and Surat.26 Decline in the demand for indigo, an item which had hitherto been important in the English East India Company's import list, further contributed to the eclipse of Surat's Europe trade. 27 From the 1740s onwards trade between the west and east coast of India too tended to get neglected.2x Holden Furber linked this decline of east coast - west coast sea-borne trade to a 'commercial revolution' in the mid-18th century 'when the conquests and rivalries of European powers fostered a rapid expansion of trade between India and China'.29

Ultimately it was this very 'commercial revolution' which gave to Bombay its great chance. There is, however, a very crucial question of timing, both of the expansion of Bengal's eastward trade as well as that of the rise of Bombay. P J Marshall in his study of private British trade in Bengal has gone along with Furber in regarding the west coast trade to be in decline by the 1740s 10 a point on which many of the writings of the last few decades on the subject are generally in agreement. 11 However, while Furber had spoken of the almost simultaneous decline of western trade and growth of eastern trade,32 Marshall has suggested that the 'eastward trade was not providing substantial compensations until the 1770s', 33 i.e. that there was a gap of about 'thirty barren years'14 between the two developments.

It might be useful to note this 30-year gap in the context of Bombay's rise. If one understands the inability of Bombay to take advantage of the decline of Surat as being the outcome of (i) a general crisis of the western Indian trade network caused by the decline of the Mughal, Safavid and Ottoman empires; (ii) decline in the Europe trade of India's west coast and (iii) Bengal's shift away from trade with the west coast; or in other words, the result of problems afflicting the foreign trade of western India as a whole, so that it would not be immediately possible for Bombay to race ahead at the cost of Surat, we must then allow some time for a new set of circumstances which could help Bombay to realise its potential to emerge. There was a lag, as Marshall observes, in the case of Bengal, where, by the 18th century, most

of the activities of the English East India Company were already centred. The lag was much more in the case of Bombay, which had to build its trading network and its spatial relationship with a hinterland almost from the scratch, as it were. As late as 1788 Lord Cornwallis found it incomprehensible that a huge establishment should be maintained at Bombay, "to load one ship in the year and to collect a very small revenue". "5 He noted with dismay that the company had "appropriated the whole surplus revenue of Benaras and Bahar (sic) to the support of Bombay", and yet was "obliged to send many lacs thither from Calcutta". "6

#### COTTON AND OPIUM TRADE

That the period after 1784 is critical for Bombay's 'take-off' has been suggested by Pamela Nightingale. 17 In 1784 Bombay's trade received a boost with the rise, she argues, in raw cotton exports to China. These were to pay for the English East India Company's increased purchases of Chinese tea, which in turn grew by leaps and bounds following Pitt's Commutation Act of 1784 which lowered the duty on tea. 4 Although there is no denying the significant role of raw cotton in the Bombay-China trade, a little circumspection is called for in regarding cotton as the commodity responsible for Bombay's breakthrough. 14 Raw cotton exports from India to China increased steadily but the search for the right commodity with which to exchange tea was far from complete. Raw cotton exports were not able to keep pace with import of tea from China.

The solution was eventually provided by opium, particularly in the 1820s when exports of opium from eastern India, which had already been rising constantly since the end of the 18th century, combined with large exports of opium from western India as well. This period saw a quantum leap in the value of opium imports into China (Table 1).

TABLE 1: VALUE OF COTTON AND OPIUM IMPORTED INTO AND TEA EXPORTED FROM CANTON UNDER BRITISH FLAG, 1824-1833

(in Spanish dollars)

Compiled from: HB Morse, The Chronicles of the East India Company Trading to China. 1635-1834 (Oxford, 1926), Vols. III and IV.

One would like to suggest that the rise of Bombay coincided with an 'opium miracle'. and consequently that it would be appropriate to move forward the date of Bombay's ascendancy in western India to the second quarter of the 19th century. The question of timing is vital. It determines the nature of colonial hegemony in a given region. This hegemony far from being uniform is determined by the outcome of an actual struggle between, among others, dominant classes of the metropolis and indigenous groups. Even when there is collaboration, the terms of collaboration are decided by the strength/weakness of the one in relation to the other. An ongoing struggle settles the matter of strength/weakness. This is an obvious point, but needs to be particularly emphasised when we note the relatively greater capacity for intervention which indigenous groups at Bombay possessed. This had an important bearing on the configuration of power and hence control of urban space.

Bombay presidency was for long unable to generate sufficient resources to support its civil and military establishments and to finance its Gujarat and Malabar investments. In 1789 the supreme government estimated that Rs 56 lakh would have to be pumped into the presidency, an echo of Cornwallis' lament of 1788 cited above. 40 In the early years of the 19th century, Bombay was still chronically deficient. Fort William was not too pleased to learn from the Bombay government in 1801 that the deficit at that "Presidency for the current year 1801-02 will probably amount to Rupees 90,25,000."41

Lakshmi Subramanian's entire thesis of an 'Anglo-Bania alliance' in western India (Surat primarily) rests on the indispensability of western Indian 'sarrafs' in facilitating the movement of money from Bengal to the west coast of India.42 The liquidity crisis confronting Bombay presidency was surmounted by recourse to local credit. Discounting Bengal bills of exchange had become big business for the sarrafs by mid-18th century. Despite growing colonial penetration of the economy, which unfortunately Subramanian underplays. "implications of local credit intervention became more pronounced and its ramifications more extensive" in the last two decades of the century.41

The issue was not merely one of finding an appropriate mechanism for the transfer of funds to Bombay. Bombay was a liability in a more fundamental sense. Lack of extensive possessions by the British in western India till the second decade of the 19th century prevented Bombay from carrying out the sort of mopping operation which the company had been engaged in within Bengal and Bihar since Plassey (and more so since the grant of 'diwani'), making

it difficult for Bombay to 'internally' finance its purchase of goods for consumption and re-export.

Perhaps the feature of economic activity in western and central India which illustrates, most vividly, the vigour of Indian enterprise in the region during the early 19th century is trade in opium. In the case of Bombay the significance of trade in this commodity derives from the capacity of Indian merchants to thwart attempts of the British Indian government to establish a monopoly of the Bengal type over opium in western and central India. They were encouraged in their truculence by the tacit or active support of numerous other indigenous groups ranging from Indian rulers in the region with their truncated authority to armed bandits. The divergent policies pursued with regard to the opium produce of Bihar, Awadh, etc., on the one hand, and that of Malwa, Rajasthan, etc. (Malwa opium), on the other, must be kept in view in the context of far-reaching implications which a non-monopolistic policy, forced on the British in western India, had on the development of Bombay.

Opium had opened up new possibilities for placing a hinterland at the disposal of Bombay. Various restrictions imposed on the export of Malwa opium from western India, beginning with Bombay Regulation I of 1805,44 however inhibited the employment of Bombay's capital Till almost 1830-31 the non-economic means employed to check Malwa opium trade only delayed Bombay's search for a hinterland by driving this lucrative enterprise away from the port and into independent, indigenously controlled avenues.

Right since the beginning of the 19th century Bombay merchants had large stakes in opium. Opium restrictions had forced them to break out of the confines of Bombay and participate in an active smuggling trade in partnership with Malwa, Gujarat and Rajasthan business groups. 45 Bombay traders could not possibly afford to give up such an important field of investment. They therefore went in for opium smuggling in a big way. The Bombay authorities had often pointed out to the supreme government that the capital at hand in Bombay would not be easily inclined to withdraw "from this profitable trade" though Bombay merchants "would, of course, much prefer buying every chest of opium in a fair and open manner, to the course they were by our measures compelled".46

It was private, particularly indigenous, enterprise which took the lead in making Bombay the centre of the economic activity of western India. For its own survival Bombay's merchant class had to make the opium (and cotton) supplying areas of western and central India into a hinterland for Bombay. Towards the end of the 1820s

the Bombay government too, largely for reasons of revenue initially (though one should not ignore the traditionally strong links between the Bombay merchants and the Bombay government), was prepared to assist in this effort. Calcutta, to which the Bengal monopoly was of paramount concern, actually delayed the emergence of Bombay as the main centre for organising the colonial plunder of western and central India. It is no coincidence then that given this crucial role of Bombay's indigenous enterprise and its success in the fight against opium restrictions, its position could not be easily undermined when Bombay became the premier entrepot for Malwa opium after 1831.

It was almost inevitable that with the removal of restrictions on Malwa opium in 1831 and the concomitant expansion of trade in the commodity, spatially capital should have got concentrated at Bombay while western and central India tast became its hinterland. This spatial concentration was, irresistible given that opium was primarily a commodity of external trade and Bombay with its outward looking aspect and its financial and other institutions was the most convenient location that could be available to indigenous enterprise for conducting the opium trade.

Opium provided to the Bombay bourgeoisie an important source of accumulation. This accumulation, together with the capital which had become available through a strong indigenous presence in the commercial activity of western and central India, could then be channelised into industrial development at Bombay. This would take capitalist development in Bombay to a new level through making it a centre of production.

During the latter half of the 19th century the major contradictions between indigenous enterprise and British interests at Bombay were played out in the arena of industry. The resistance of the early 19th century ensured continued participation of indigenous enterprise at Bombay, symbolised by Indian control over the city's cotton textile industry founded in the 1850s.

The distinctiveness of the western and central Indian colonial situation had its impact on the urban development of Boinbay as a

TABLE-2 PERSONS PER HOUSE IN BOMBAY, 1826

capitalist port city. From an urban sociological perspective Bombay is representative not so much of a colonial city with its colonial/indigenous spatial dualism, but is an easily recognisable capitalist city with class differentiation determining its spatial pattern.

II

The nucleus of early British Bombay was the Fort area, situated along the south-eastern tip of the original island of Bombay and facing the harbour. Commuting to the Fort area of Bombay was to gradually become a significant feature of the city's life as residential areas came up at some distance from it. To start with, the security which the Fort provided, coupled with its location near the harbour and docks made it not only a commercial and administrative centre but a residential area as well. Eventually the Fort became hopelessly overcrowded and as we shall see it required a major fire in 1803 for some planning to be contemplated. The physical geography of the part of Bombay in which the Fort was located permitted expansion only in one direction, that is, towards the north. South of the Fort, the narrow strip of Colaba and Old Woman's Island had very little scope. To the west of the Fort there was some open space, the esplanade, and beyond it Back Bay.

The esplanade was usually left unbuilt in colonial cities as a convention, mainly for military reasons. It was of the nature of a clearing outside the Fort 'intended to prevent any person approaching the town without being seen from the citadel'.<sup>47</sup> The grand public buildings on the eastern edge of Bombay's esplanade were not constructed before the latter half of the 19th century.

With growing congestion in the Fort area, the appropriation of land within it primarily for commercial use, and with relatively greater security. Malabar Hill with its extension Cumballa Hill became the fashionable residential area for the colonial rulers. This was the more so after the governor shifted his residence from Parel to a most enviable site on the edge of Malabar Hill, overlooking the sea. This area was not too far from, yet not too near, the hub of activity in the city.

North of the Fort and separated from it by the esplanade was the main indigenous habitation zone. This zone was, until its subsequent further expansion to the north, almost walking distance from the Fort and the docks where many of the Indians found employment. As business grew and got attracted to the Fort area, it made sense to live in this zone and thereby cut down on commuting time, a crucial consideration in an age when mass rapid public transport was non-existent. As it is, Bombay being an

island, expansion in all directions was out of the question. Moreover, during the 18th century the salt flats in the centre of Bombay island were still in the process of being reclaimed, delaying the dispersal of population over this area. When in the latter half of the 19th century Parel and the area beyond towards the north and upto the waterfront in the east developed as industrial centres, population got concentrated along a diagonal running roughly from Dongri to Worli. This diagonal was more or less equidistant from the factories lying to the north and north-east of it and the commercial centres lying south and south-east of it. All this was of course before Salsette was seriously developed into a suburb of Bombay.

Some figures pertaining to the population of Bombay during the early 19th century are available which, though they may not be entirely accurate, give us a broad idea of the demographic situation in this period. It was estimated in 1814 that the permanent population of the island "may now be taken at 1.80,000 souls".48 The floating population was put at 60,000 making a total 2,40,000.49 This was an appreciable increase over the figure for the last quarter of 18th century. In 1780 the population of Bombay was supposed to have been 47.170.50 Already by the turn of the century there was a marked increase in the population of the city - or, at least, that was the general impression of contemporary observers. Maria Graham noted in 1809, shortly after the influx caused by a famine in the Konkan and Deccan, "I was informed that Bombay contains upwards of two hundred thousand inhabitants".51

#### POPULATION INFLUX

The influx seems to have been of a transitory nature. It certainly did not make Bombay a major centre of either production or consumption. When in 1805 Fort William was considering a plea made by the Bombay government for abolishing town duties, reference was made "to the limited consumption of the Town", owing to which "the amount realised from the Town duties at that Presidency" were "too inconsiderable". There was consequently no reason why the request should not have been acceded to. The supreme government hence recommended that the duties be abolished. "Suppose to the supreme government hence recommended that the duties be abolished."

The movement of population towards the city confirms however that Bombay's coastal/shipping links were stronger than its (overland) links with its interior. This enabled it to avoid serious food shortages. Foodgrains could be imported via the sea. Bengal was a major supplier during the Konkan famine of 1803. Naturally a number of people afflicted by the famine sought succour in privileged Bombay (see Appendix A).

There is a likelihood that early population figures were inflated. This is made apparent by a census of Bombay taken in 1826 which put the total population at only 1,62,570, i e, lower than the estimates for 1814.<sup>54</sup> In 1833 the population had risen to 2.34,032,55 a crude rate of growth of 5.34 per cent per annum. Another census, taken on May 1, 1849, recorded 5,66,119 inhabitants.56 By 1864, 8,16,542 persons resided in the city.<sup>57</sup> In other words the rate of growth of population between 1849 and 1864 had declined to 2.47 per cent per annum. Although as D R Gadgil had pointed out in the context of population statistics for Bombay that earlier counts appear to be over-estimates,58 the general impression one gathers is that the 1830s and 1840s were a period of very rapid increase as compared to the 1850s and 1860s. The overall rate of growth between 1826 and 1849 was 5.57 per cent per annum. This rate of growth was higher than that which occurred from 1849-1864 (2.47 per cent per annum), as well as for the overall period from 1826 to 1864, 4.34 per cent per annum.

By the end of the first quarter of the 19th century the bulk of Bombay's population was to be found in Dongri, Byculla, Mahim, Girgaum and of course the Fort. Dongri and Byculla with 47,359 and 31,083 inhabitants respectively accounted for as much as 48.25 per cent of Bombay's total population in 1826.<sup>59</sup> However, the Fort area was still the most densely populated part of Bombay. It contained 13,611 persons in 1826<sup>60</sup> (as against 10,801 in 1813<sup>61</sup>), who resided in 1,219 houses, that is, about 11.2 persons to each house. Table 2 gives figures for persons per house in various parts of Bombay in 1826.

These figures do not include the military and floating population of Bombay, which was put at 10,000 and 20,000 respectively.<sup>62</sup> It is unlikely that the floating population of

Hombay would have easily found accommodation in the Fort, Colaba or Malabar Hill. This group would have mainly been dispersed over the indigenous zone thereby pushing up the density of those areas.

W H Sykes observed with reference to the 1849 census of Bombay that the "native town east of Bhendy Bazar contains more than two-fifths of the entire population of the Island". A Sykes further drew attention to the immense excess of males over females in Bombay, there being 3,54,090 males to 2,12,029 females in 1849. One of the reasons for this was that "Bombay comprises a large number of seamen, workmen in dockyards, factories, etc., who come without their wives".

Bombay was eventually placed in an arbitrarily privileged position due to colonial intervention. As such it was able to attract a large population which could not always be efficiently utilised given Bombay's lack of hinterland and its weak links with the interior. Consequently there was bound to be a section of the population which could not be provided steady employment. At peak times, particularly during the sailing season, some of the casual labour was able to find work in dockyards, cotton screws, etc, but this labour would have been redundant for the remaining part of the year when it would be forced to leave the island or possibly look around for means of self-employment. Warden's impression was that one-fourth of the population of the island was 'floating' in 1814. This floating population comprised "Camatees, Ghatees, Carwas, Maharattas, Arabs, Persians and Goa Portuguese, a great part the sea faring men, with many Parsees".66 These temporary residents remained in Bombay a few years, hoarded their earnings. "having saved from two to three hundred rupees, return to their native country, where they obtain as much land as they require".67 Much of this casual labour therefore retained a strong connection with land, something which would have inhibited the process of creating a large wage-earning class. Till such time as colonialism tightened its grip on the western Indian countryside, the possibility of falling back on land would have definitely prevented complete degradation of this floating population of Bombay. This is in sharp contrast to, say, the casual labour of London, which had really no land to return to, and was, therefore, forced to submit to the most inhuman living conditions.68 In England, of course, the supropriation of the countryside was extremely drastic and has never exactly been duplicated elsewhere." In western India too the rural uption was closed for urban dwellers once colonial exploitation led to a deteriorating agrarian situation. The fundamental difference was that in England agriculture had been rationalised; in western India, as in India as a whole, or for that matter in other colonies the situation was the reverse.

In Bombay city itself the strength of indigenous enterprise, the transfer of the opium trade to the city, the vitality of commercial activity and industrial development did help in partially overcoming the problem. In 1826 the floating population of Bombay was, as we have noted, placed at 20,000, a sudden drop as compared to the estimates of 60,000 for 1814. Too much should not be read into the decline of this component of the population within the space of just 12 years. Firstly, total population placed at 2,40,000 in 1814 was 1,62,570 according to the count of 1826, which in turn may be explained to some extent by an overestimation of the earlier figure. Secondly, we are completely in the dark about the precise definition of the category 'floating population' for both years. In the absence of information about what criteria were adopted for classifying someone as belonging to this category, a proper comparison between these two figures cannot be made. Suffice it to say that there was a sufficiently large floating population in the city during the first quarter of the 19th century, which may have been showing a downward trend during the late 1820s as a result of new avenues that became available with increased economic activity in this period.70

With the development of capitalism in Bombay it was necessary to ensure that those who came to the city did some work, even if it was something most dismal requiring much labour and yielding but a pittance. To be absolutely idle and unemployed, to give oneself up to vagabondage could mean taking to a life of petty-thievery. In a city where traditional ties did not exist, very much more so as Bombay had no pre-colonial past, the lack of such ties being underscored by market relations, little support from the community was forthcoming for anyone who had the misfortune of being totally without means of livelihood. Such a person might constitute a threat to property, he might rob, steal, burgle. This, capitalist society with its precise notions of property, does not tolerate. There were stringent provisions, therefore, in Bombay "for sending aliens off the island", particularly those who "live idle without work".71 Such persons could "be committed to iail, be flogged, and, upon a second conviction, upon production of the former record, they may be sent off the island".77

LABOUR, PRODUCTION AND URBAN SPACE

The division of labour and production for exchange which capitalism presupposes and the encapsulation of this division of labour within urban space leads to a major contradiction: while urban space must be appropriated for functions related to the accumulation of capital, this accumulation of capital is a negation of self-sufficiency and requires the apportioning of space for classes which live only by their labour. As economic activity gets concentrated in urban. areas due to the convenience of finding there the necessary labour as well as the infrastructure - finance, banks, credit facilities, transport, expertise, etc, - needed for the accumulation of capital (which in turn reinforces this concentration), the contradiction mounts. There is a tendency to apportion as little space as possible to the poor. This is not merely a matter of land value, which is bound to go up with such concentration and which as adding to the cost of production is somewhat offset by the abundance of labour within the urban area. but is also a matter of not providing adequate amenities for the poor, It is, however, desirable to have a growing population of those who are willing to sell their labour power since this allows a large residual section which can be both casually engaged and recruited if there is any attempt on the part of any group of workers/wage-carners to exert pressure for improving their lot.13

In a colonial situation even greater concentration occurred because an urban centre like Bombay was made the instrument of transferring the surplus of the surrounding hinterland to the metropolis and within this hinterland capitalist/industrial development was not encouraged. The territorial displacement of capitalism in 19th century colonial western India was complete as local urban centres were unable to develop. What we encounter is not a mere rural/urban dichotomy, which, incidentally is not an antagonistic one but an expression of a division of labour in society. We witness the appropriation of the hinterland for the benefit of the metropolis via a favoured urban centre. i e. Bombay. Indigenous enterprise, which too was drawn to the infrastructure offered by the port speeded up this process of concentration by helping in the appropriation of the hinterland. Indigenous intervention even with its own possibilities of capitalist accumulation could not but accelerate the emergence of Bombay as the focal point of the economic activity of western India. Hence, the disproportionate concentration resulting from activities relating to (a) colonial plunder; (b) indigenous enterprise; and (c) lack of adequate urban and economic development of the hinterland areas. Lastly, Bombay, it should not be overlooked, was a major administrative centre.

Generally speaking the appropriation of urban space is not just functional, but determined by class. Specifically in the context of Bombay the contradictions between colonial interests and various

weakness of these groups vis-a-vis colonial rulers as well as the position of these groups vis-a-vis each other determined its spatial pattern. Once again it is necessary to reiterate that Bombay is not strictly representative of a 'colonial city' with the connotation the term has of colonial/indigenous spatial dualism.

It should not surprise us that in view of Bombay's marginality during the 17th and most of the 18th centuries there should not initially have been much pressure on space within the city. As a consequence it took some time before rights to land began to be asserted. One general observation must be made here. The question of space became vital for one area - The Fort - very early on. This was because the Fort provided security; it was the main administrative and commercial centre; it was located adjacent to the harbour; and the seven islands of which Bombay was formed were still in the process of being connected so that it was not feasible for habitation to be widely dispersed.

The year following the transfer of Bombay from the crown to the East India Company, an official proclamation (which remained a dead letter) stated that all acquisition of land by individuals prior to 1661 proceeded from imperfect right.74 A few years later, in 1674, an important step was taken in the direction of the development of land as private property. Recognition was given to all the land then occupied, subject however to one condition. This condition was that occupants of land were liable to military service, the tenure being regarded as feudal.75 Significantly an added provision was that occupants could not be deprived of their holding without compensation.76 These arrangements were apparently applicable essentially to the Fort area, for in some of the other parts of Bombay - Girgaum, Chowpatty, Walkeshwar, Cumballa Hill and Mahim a tax called 'pension' was levied.77 This was of the nature of an agricultural tax on garden or rice land computed "at so much per wheel for irrigation".78 Although, according to Warden it would appear "that a very small part of the Island was in a state of cultivatio" at this date,74 technically these areas were not adequately urbanised.

In 1718 the pre-capitalist form (military service) which rent had taken in the Fort area was converted to a tax expressed in money, referred to as quit-rent. \*\*O This was really a tax for a service rendered by the state, rather than a rent on land. No argument in terms of a superior right to land was put forth. Quit-rent was legally only a reimbursement for expenses incurred in erecting fortifications. \*\*I To put it differently, it was a tax for providing security. Since if was the Fort and the surrounding area which benefited

land in the Fort, Colaba, the 'Black' Town and the New Town. The 'Black' Town and the New Town refers to the indigenous zone lying north and north-west of the Fort. #2

By the 1730s efforts began to be made to assert superior rights of the colonial rulers to land. This was obviously the easiest way to exclude, or at least limit indigenous access to land. Growing pressure must have been a cause for worry. Indians were preempted by a discriminatory taxation policy. A resolution of 1731 drew a distinction "between the English and black inhabitants". This policy did not deter Indians from acquiring landed property on an extensive scale in Bombay, a situation to which the strength of indigenous enterprise contributed in no small measure. In 1803, as we shall see, another attempt was made to undermine indigenous control over land in the Fort. The attempt proved to be futile. By the second decade of the 19th century there seems to have been an all round strengthening of property rights along capitalist lines with reduced colonial arbitrariness. Such colonial arbitrariness acts as a serious limitation to the proper exercise of bourgeois right by discriminating essentially along racial rather than class lines. in 1814 Warden advocated the further strengthening of private property."4 In that year the right of tenants to inherit and alienate land was also accepted."

The Fort area being the focus of Bombay's economic world, the actual outcome of the conflict between colonial rule and indigenous capitalism in Bombay was mirrored in that small strip of land. Just as the British were unable to completely overcome opium smugglers so too they could not prevent Indian merchants from gaining a foothold in the Fort area. Moreover, if Bombay's bourgeoisie was an important participant in the commercial life of the city its desire to be in close proximity to that infrastructure which colonial interests had spatially concentrated in the Fort was but natural. It would not be out of place to state here "that in 1707-8 the greater part of the ... Fort was private property; ...[and] that, for the purchases made from 1707-08 to 1758-59, it became the Company's and was subsequently transferred to individuals". No What this implies is that as by the beginning of the 19th century Indians were substantial owners of property in the Fort they must also have been involved in these large-scale purchases made during the latter half of the 18th century. Investment in real estate increased in this period: "the greatest portion of the property will be found to have been created since the year 1758". \*7

In 1803 a major fire broke out in the Fort. \*\*
DE Wacha recalled in his reminiscences that he had heard from his grandmother 'in the

the time the news of fire, large or small, was one to fill the citizens with extreme consternation, for it meant, in nine cases out of 10, total destruction of life and property". The fire became an occasion for trying to oust Indians from the Fort. This is understandable when we consider that land values in the Fort escalated shortly after the fire. Just before 1803 the price of land had been on average from eight to 12 rupees per square yard. Subsequently to 1803 land in the Fort was selling at prices ranging between Rs 16 and Rs 30 per square yard.

A town committee was appointed following the fire ostensibly "to investigate the nature of tenures" in tracts laid waste by the calamity.41 Under the garb of examining the nature of tenures in the Fort, the committee sought to obstruct reconstruction of indigenously owned buildings. 92 This was met with stiff resistance by Indians. They were not prepared to accept this threat to their right to reside and own property in the Fort. Though the town committee attempted "to carry their plans into effect, as well by threats as by persuation", the "natives ultimately succeeded in their opposition, and in the object of rebuilding on their old foundations". 43 Even the Court of Directors concurred in "permitting a native town within the Fort".44

We find Hormajee Bomanjee constructing his family residence in the Fort during the first decade of 10th century at an estimated expense of one and half lakhs of rupees. "Ardaseer Dady owned four buildings in the area." Mottichund Amichand had his premises in Bazargate Street. Besides, Cursetjee Manockjee, Kesowdass Ransordass, Moosa Mapla and Pestonjee Bomanjee also owned land in the Fort during the first quarter of the 19th century. Coercion having been unsuccessful, Indians were induced in this period to exchange land held in the Fort for large tracts of ground in Salsette, which was still in an undeveloped state.

#### INFORMAL SEGREGATION

Within the Fort itself there was some informal segregation. Indians clustered around the northern part of it whereas "in the southern part ... congregated the official European population". " Little planning had gone into the development of the For: " In the late 1820s it conveyed the impression "of a large irregular village than of a town".101 Writing in 1809, Maria Graham had observed that the Fort was "Dirty, hot, and disagreeable, particularly the quarter near the bazar-gate, owing to the ruins of houses which were burnt down some time ago, and have never been removed; but new buildings are in many places rising on the broken fragments of the old, so that the stricts are become so uneven as to render it disagreeable if not dangerous, for carriages to pass through them". 102

The bazar-gate was located at the northern end of the Fort, in the area where the indigenous inhabitants resided. The houses of Indians within the walls were "closely crowded together, very high, and mostly built of wood".103 The fact that they were made of wood must have added to the risk of fire. If even after the fire of 1803 wood continued to be so much in use as building material, bricks and stone must have been difficult to procure. As it is the expenses of building were great, owing partly to the high cost of labour, and accounted "for the apparently moderate profit enjoyed by the builder". 104 Hence, probably, the extensive use of wood. The wooden houses in the fort "with their wooden verandahs, venetian blinds, and heavy sloping roofs, covered with tiles' had a 'Swiss rather than Oriental appearance". 105 The absence of chimneys in these houses caused 'them to look as if they were so many warehouses'.106

There were certain physical limits beyond which it was not possible to go on adding buildings within the Fort area. By the end of 1820s "substantial buildings [extended] to very nearly three miles from the Fort". 107 Some efforts were made to relieve the congestion in the Fort area, though not always with much success. In the period after the fire, Indians had been persuaded "to limit their houses in respect to height and taking off from each front a portion of ground for widening the streets".108 Then in 1839, legislation pertaining to building construction in Bombay, Act No XXVIII, laid down that no building with a height extending 50 feet could be erected within the walls of the Fort. 109 Yet as late as the 1860s, the authorities noted that, "The Fort has hitherto been strictly limited by its ramparts..., but while its lateral extension has been prevented, there has been no restriction as to the number of storeys that might be added to houses".110

South, north and west of the Fort there was some open space. This could not be used for expansion partly for physical and partly for strategic reasons. Colaba and Old Women's Island were not fully integrated with Bombay till quite late. 111 Colaba was initially a cantonment area, although towards the beginning of the 19th century it was opened up for civilians. 112 The proximity of Colaba to the Fort, its spaciousness and fine view soon made it prime land. In 1805 the East India Company paid Rs 60,000 for purchasing eight houses in Colaba. 113

The large expanse of the esplanade merging with the sea on one side and with the indigenous zone on the other provided, apart from its strategic significance which has already been alluded to, much needed escape from the claustrophobia of the Fort. It was

a place where one could go for a breath of fresh air, for some recreation and for some exchange of gossip. Even in the third quarter of the 19th century the esplanade retained its calm. Despite the railway, textile mills. the cotton boom and rise in population the pace of life was still unhurried along the esplanade. Wacha gives a most vivid description of pleasant evenings spent here during the 1850s: "... squatting groups would be seen merrily playing games of cards... Refreshments were also vended. The only refreshment was the sugar-cane, stripped of its bark and cut into small cylindrical pieces which again would be subdivided into four. A large number of vendors, also Parsis, selling this fruit... moved from group to group..."114 Further.

the grounds on which now stand the Post Office... and the High Court were also utilised for recreation purposes, but evidently it was dedicated to the 'shettia loque' or the wealthier of the Parsi community. Members of this class, too, frequented the maidan and had their little groups – only these were a little more exclusive... These, too indulged in the luxury of 'ganderi' and also of confectionery... 115

It is pertinent that the esplanade was not appropriated exclusively for the use of colonial rulers.

Malabar Hill comes closest to King's concept of 'colonial settlement' in colonial urban centres as an area where the European civilian population resided and from which indigenes were almost entirely excluded. Indians, however, owned a lot of land in this area as well. Framjee Cowasjee "owned a few bungalows there" as did Hormusjee Cursetjee, son of Cursetjee Manockjee one of the prominent owners of land in Bombay whose property in the Fort has already been referred to above. Ith Kemp and Company had their medical dispensary in Malabar Hill in premises rented from Hormusjee Cursetjee's widow, Meheribai. Ith

Owning property in Malabar Hill was one thing but residing there was another. For Indians to stay there was not the done thing. In the 1840s "the healthy eminence of Malabar Hill was quite untenanted by any Parsees". 120 Houses owned by Parsis "were without exception occupied by Europeans", 121 When in 1848 Meheribai decided to shift to Walkeshwar, the step caused an outery which obviously had some sexist overtones as well: "The Parsee Punchayet the body conducting the social governance of the Parsee community, gave it out as their grave opinion, that it was anomalous for a Parsee lady to live in such an out-of-the-way locality". 122 This exclusive quarter extended almost upto Breach Candy at the northern extremity of Cumballa Hill. Breach Candy soon became "the general rendezous of the English community, where they met to settle the politics of the island, and to discuss the affairs of the day..."121

Class differentiation in Bombay was most sharply delineated in moving from the rarefied atmosphere of Malabar Hill. Walkeshwar, Cumballa Hill and Breach Candy to the Native Town north of the Fort. Here too as the demand for housing increased with the rise in population during the early 19th century, the value of land went up. Those who owned land took "all possible advantage of the area in their possession by building to its full depth" and "raised floor upon floor".124 Moreover, "some owners of plots of ground which have a frontage such only as may have been sufficient for a huckster's stall before the street attained to its present importance, have built with this small frontage, but with a greatly disproportioned depth, houses of many floors". 125 Consequently the overcrowding was oppressive. Dwellings were at times constructed by filling a wooden framework with brick and mortar or rubble masonry. In the poorer streets the walls were made entirely of wood. This rendered the structures insecure as was "shown in the many accidents that have resulted from falling houses in the 10 years ending with 1862. Besides many being maimed, there were 69 killed in that time".126

Congestion in the indigenous zone was in direct proportion to the concentration of economic activity in the Fort. In the absence of an even spacing of economic activity it was natural that those who had only their labour power to sell could not be widely dispersed but had to be as close as possible to the area which could provide them work. As Indian enterprise too tended to get concentrated in the Fort, reinforcing the economic significance of the area, the spatial disorientation of Bombay was ensured. We have also noted that Bombay during the first quarter of the 19th century could not efficiently utilise its large population. The fact that the Fort area was not a producing zone, rendered Bombay's labour even more underemployed. This meant that many were forced to be self-employed as pettyshopkeepers, hawkers, vendors, etc. It was possible to sustain oneself to a limited extent on this kind of activity since Bombay's wage-earners had to buy the necessities of daily life. Maria Graham recording her impressions of a visit to a Bombay bazar

Here you see grain of every description heaped in earthen jara; there, sweetmeats of all sorts and shapes, .... Further on, fruits and vegetables are laid out to the best advantage; then you come to the paung, or betel leaf, nut and chunam, ready for chewing, or the separate materials; beyond are shops for perfumes, linens, oils, toys, brass and earthenware...<sup>127</sup>

economic activity related to vending articles of daily necessity become that the Bombay authorities sought to impose a tax on shops and stalls. Act XI of 1845 provided "that it shall be lawful for the collection of Land Revenue of Bombay to make a Quarterly Assessment on each and every shop and stall within the Island of Bombay and Colaba". 128 The types of shops and stalls listed convey some idea about the nature of business in articles of daily necessity: Apothecary (Country), Bakers, Bread Sellers, Beteinut Sellers, Curds and Cream Sellers, Darners, Dinner Leaves Sellers, Onion, Garlic, Ginger, Potatoes and Yam Sellers, Pickle Sellers, Rice Sellers and, Tea and Sugar Sellers. (Bombay Calendar and General Directory, 1849 (BCGD), p 252).

The Native Town must also have had some autonomous economic activity, but this being on too small a scale and at a very low level, ultimately dependence on the Fort was crucial. This desperate dependence on the Fort must have been another factor in the disproportionate concentration in that area.

Such a situation in the main indigenous zone and the Fort led to unhygienic conditions. Until the lower classes could improve their bargaining position, little development of proper civic amenities for the poor took place. A H Leith, as deputy inspector-general of hospitals in Bombay, in a report of 1864 on the sanitary conditions in the city, reported that in a particular street "the houses on each side were of two or three floors, and the various rooms were densely peopled, and the floors of the verandahs were fully occupied, while to eke out the accommodation in some of the verandahs there were charpaees or cots slung up and screened with old matting to form a second tier of sleeping places for labourers that were employed in the day".129

In one of the chawls that Leith visited, he found "... in a narrow unpaved court, which was wet with the waste water of a well round which the people were bathing, there was a cesspit full of filth: in the same enclosures there was a row of necessaries behind which there was an unbuilt trench full of fluid excreta and foul water, the over-flowings of which passed along the base of the wall surrounding the mouth of a well that was but four feet from the privy. This well supplied its owner's household with drinking water. In this Chal there were ten cholera deaths". 130

Elsewhere he was led to latrines where "baskets which cannot retain liquid are used under the privy-seats, and those privies have a flat floor, and... as is often the case, not even a basket is used, and a sweeper never visits the place, but the accumulated soil is left to flow out on the pavement of the gullee..."<sup>[13]</sup>

So very extensive did this variety of conomic activity related to vending articles of daily necessity become that the Bombay atthorities sought to impose a tax on shops and stalls. Act XI of 1845 provided "that shall be lawful for the collection of Land evenue of Bombay to make a Quarterly ssessment on each and every shop and stall

The abysmal sanitary conditions prevailing in the Fort and to a greater extent in the Native Town were bound to result in the contamination of drinking water thus leading to cholera and other contagious and waterborne diseases. The shortage of water supply compounded the problem. Even British inhabitants had at times to procure water from distant sources. An entry of 1825 in Lady West's journal states, "we had 63 bottles filled yesterday at the Caves of Elephanta for drinking". 133 Repeated monsoon failures between 1824 and 1850 led to the drying up of the 136 public wells and tanks on which the inhabitants were completely dependent for their supply of water. By 1854 only eight of these wells and tanks contained good, potable water.134

In the 1850s a major project for the supply of water was under consideration in Bombay. The project was to be financed largely through an increased house tax.<sup>135</sup> Mariam Dossal's detailed study of this project has shed light on an important facet of this issue. The wealthier Indians led by Jamshetji Jejeebhoy, were not favourably inclined towards the project as they would have had to "submit to a heavy tax for such works".<sup>136</sup>

The matter was one of class interests. Privileged indigenous groups were not keen to provide amenities to the deprived sections if there was to be increased taxation. It might seem a contradiction that whereas the affluent sections tried to stall the move, it is the colonial state which was in this case taking the initiative in improving civic amenities. Enzo Mingione in his work on capitalist urban problems has pointed out that, "As the taxation system is based on residents,... any change discourages capital accumulation because it becomes - one way or another a direct taxation of economic activities".137 From the point of view of Bombay's capitalist class the question was whether it would be prepared to bear the high costs of urbanisation. In an overall situation of colonial constraints to accept this responsibility would have further reduced their scope for capital accumulation. One must recall here that indigenous investment in Bombay's housing and real-estate was extensive.

Life in the Native Town and Fort during the early 19th century must have been a miserable one. This was the more so as with the growing stability of British rule, security and overcrowding, the English inhabitants

of Bombay removed to the more familiantification and Malabar Hill, abandoning the Fort to commerce, and middle and upper class Indians. Of course there were still European residents in the southern part of the Fort, but what one is referring to is a tendency. 138

North and central Bombay did not come into their own until the industrial era. Just north of Dongri along the sea was Mazagaon. In 1826 it had a population of 4,696.<sup>139</sup> Maria Graham referred to it at the beginning of the century as "a dirty Portuguese village". <sup>140</sup> Even today there is "a very Portuguese air to Mathapakardy, the small settlement that nestles quietly in the heart of busy Mazagaon". <sup>141</sup> Not being very far from the Native Town or even the Fort, and due to its importance as a ship-building centre, Mazagaon was a settlement of some importance in the early 19th century.

Several portions of north and central Bombay had been reclaimed only during the early 18th century. 142 Having been reclaimed largely at government expense, the land had been let out to individuals, mainly Indians, for improvement. Most of this land was of the nature of salt marshes, and was designated 'foras'.147 Foras (lit. 'out of doors') denoted rent "paid by a cultivator or person permitted to occupy ground for the purpose of improving it". 144 Large tracts of Bycuila, Parel, Worli, Mahim, Dadar and Matunga were foras lands. 145 With the rising value of land in Bombay, the government tried to undermine the rights of holders of foras at the beginning of the century.146 At the same time the company contemplated an increase in rent, "but the holders of these grounds strongly resisted". 147 Eventually "the measure of increasing the rents was suspended, and the matter referred to the Hon'ble Court of Directors in 1815". 148 The matter was settled for the time being with titles of those "persons who were in possession in the year 1744" being recognised in perpetuity.149

The question of rights was reopened in the 1830s. In 1836 the construction of a major thoroughfare in central Bombay, passing through foras lands, was projected. 150 This thoroughfare, Grant Road, now Maulana Shaukat Ali Road, forming a junction with Girgaum Road was to have an east-west alignment. In 1838, work on the road commenced and the foras lands through which it passed were acquired without any compensation being paid. 151 Rapid expansion of the city and the construction of Grant Road must have further increased the value of land in central Bombay. In the 1840s we find leading merchants like Juggonath Sunkersett and Bomanjee Homasjee investing in land in the Tardeo and Grant Road area. 152

Parel, where also several foras holdings were located, had been a favoured resort in

23 4 Alg + 3 B

the 18th century. The governor had his residence here which with preference being increasingly shown for Malabar Hill was abandoned during the course of the 19th century. The threatened northward expansion of the indigenous zone and the overall southward shift of the European residential zone - Colaba and Malabar Hill - completed the eclipse of Parel. Some upper class Indians did continue to have their country residences in Parel during the 19th century, the most well-known being Pestonjee's 'Lal Baug'. The famous Lowjee family, it might be mentioned in passing, had been given 'inam' or cess-free grants in Parel and adjoining Naigaum in 1783.151 In the latter half of the 19th century this area became mainly an industrial zone.

#### MAHIM AND SALSETTE

Mahim had been an important settlement since the Portuguese days and was the most thickly populated area in north Bombay at the beginning of the 19th century. Mahim was estimated to have 13,726 inhabitants in 1760.<sup>154</sup> In 1826 the population of Mahim (including Worli) was 17,713.<sup>155</sup>

During our period Salsette, the large northern neighbour of Bombay, was still a backwater. It is only towards the end of the 19th century, particularly with the improvement of communications, that Bombay began to spill over into Salsette. Salsette was to become an 'umland': the 'umland' of a city being that portion of the surrounding country which is linked with the city as a centre. 15th As Bombay's physical geography permitted only northward expansion, the merger of Salsette with Bombay was inevitable.

Salsette had been one of the earliest additions to the Bombay presidency. It was "at the time of its acquisition much depopulated and scantily cultivated".157 With the growth in demand for food in Bombay, Salsette was sought to be better cultivated. Leases were granted on favourable terms to attract settlers.158 Bishop Heber refers to vegetables grown on Salsette being brought to the Bombay market.159 At the same time Heber noted that the island was "strangely unimproved having no towns except Tannah and Gorabunder (the first of which is indeed a neat and flourishing place, the other not so much better than a poor village)" 160 He went on to say: "This neglected and uncivilised state of Salsette is all the more remarkable,... because the neighbourhood of Bombay, and the excessive price of provisions there, would seem to lead to the cultivation of every inch of ground".161 Finally, Heber remarked that, "The population, however, poor as it is, and chiefly occupied in fishing, amounts to 50,000, a number which might be trebled if cultivation were extended at anything like the rate which it has been done in Bengal". 142

The main reason why the supposed capacity of Salsette remained underutilised was that cultivation called for a large investment. According to a report of 1836 one of the major obstacles in the development of Salsette was "the nature of the soil itself, which is not capable of being made productive without the constant and unceasing aid of expensive appliances". 163

There is one sense in which Salsette was tied to the economy of Bombay in the early 19th century. It provided a field for investment in land. Several prominent merchants of Bombay had been granted holdings in Salsette in this period, some of which had been given in exchange for land in the Fort. 164 Ardesar Dadaji had been granted the villages of Malhar, Dysar, Magatney, Tulsi, Areyn. Eksar, Kanari and part of Pahadi in lieu of land in the Fort. Hormasjee Bomanjee had similarly been given the villages of Kurlen, Maroli, Asalpay, Kolikalian, Mohili, Paraipor and Shahar (collectively referred to as the Kurla estate). 165 Some of the other prominent landowners in Salsette were: Cursetjee Manockjee (Anik); Dhakjee Dadajce (Varsavay); Framjee Cawasjee (Poway estate), Jamsetjee Bomanjee (Vila Parla, Jhu); Kharsetjee Cowasjec (Goregaum); Ratanjee Eduljee (Gatkopar); Krushnarao Raghunath (Borvday); and Luxmon Hurrichanderjee (Chincholi).166

It would seem that some of the indigenous investment in Salsette was of a speculative nature. It was rare for Bombay merchants to go in for investment in agriculture.167 One of those occasional instances is that of Framjee Cawasjee who tried to introduce scientific agriculture on his Poway estate. The relatively greater stability of indigenous enterprise in Bombay did not incline Indian merchants towards large investments in agriculture. Urban real-estate, over which they already had significant control (Pestoniee Bomaniee boasted to Maria Graham "that he received not less than Pond 15,000 a year in rents and his brother received nearly as much"),168 held greater attraction for them.

The development of capitalism in Bombay was not only expressed in the specific spatial pattern of the city but also in the availability of certain facilities and services so characteristic of a capitalist city, especially a major administrative and commercial centre. To some extent such facilities were the outcome of Bombay's privileged position within the colonial scheme of things: systematic appropriation requires an infrastructure.

In the context of early 19th century colonial Bombay the growth of specialisation could at times be deceptive, especially at the lower level. The non-manufacturing nature of Bombay in this phase must have, as we have already noted, led to a number of people becoming hawkers, vendors, small-shopkeepers, carriage drivers, palanquinbearers, etc. Unfortunately our information is limited to those services and facilities which were usually availed of by the English or upper class Indian inhabitants of Bombay.

There were, by the late 1830s and early 1840s several hotels, coffee-shops, eating houses and confectioneries in the city. In contrast to the situation at the beginning of the century when Maria Graham lamented that "there is but one tavern in Bombay and... that is by no means fit for the reception of ladies",169 and a similar statement by Mrs. Elwood in the late 1820s that "... it is most singular that there are no hotels to which a lady could with propriety go", 170 several hotels came up between the late 1830s and early 1850s: Victorial Hotel, Hope Hall, British Hotel, Madam Costa, Royal Family and Benson Hotel. 171 The hotels proclaimed their respectability by announcing the availability of accommodation for 'Families and Gentlemen'.122 These hotels were not exclusively European owned but had indigenous involvement as well. Victoria Hotel in Apollo Street had, for instance, Nasserwanjee Cooverjee as one of its owners.173

The Shop and Stall Tax of 1845 differentiated between two kinds of eating houses. Eating houses for Europeans on which the quarterly assessment was Rs 4, and ordinary eating houses (apparently for non-Europeans) on which the tax was one rupee. 174 The implied segregation is significant. A similar type of establishment referred to in the list pertaining to the Shop and Stall Tax is the coffee shop. 175

The taste for European confectionery was not limited to the British residents alone, but had percolated down to some indigenous sections as well. Indians were also engaged in vending this kind of confectionery. Dhunjeebhoy Framjee's bakery was one of the well known establishments in the early forties. 176 In the forties itself Rustomjee Framjee was one of the two 'iceconfectioners' in Bombay, the other being a European. 177 Wacha tells us of "a Parsi who had a bakery in Barrack Lane" in the 1850s. A shop, familiarly known as 'Bahadurji's Bakery' "had the custom of the rich and middle class Parsis", while another 'humbler confectioner of the Military Store Lane supplied the needs of the lower classes'.178

At a more mundane level, we have seen that the supply of food to Bombay had been taken care of largely through sea-borne trade. For highly perishable commodities like vegetables and fruits, however, local production was necessary. Among the vegetables grown in Bombay were brinjals, bhindi, various types of gourds, and sweet potatoes.<sup>179</sup>

Peas and beans were also grown but were of 'indifferent quality'. Not much success had attended planting of cabbage, carrots and turnips. There was some specialised horticulture also im Bombay was famed for its onions;181 Mazagaon for its mango.182 Finally, some rice was still cultivated on the island in the early 19th century.187

As settlements got dispersed over the island, the demand for transport also increased. Buggies, carriages, carts. palanquins, etc, were available for hire.184 The rise in their number necessitated legislation to regulate such transport. Act No IV of 1841 allotted specified parking places (stands) for public vehicles and palanquins. 185 The phenomenal rise in utilisation of road space can be guaged from the following statement pertaining to the 1860s:186

As many as 598 carriages in addition to bullock carts were counted passing along the Bhendy Bazar in one hour, and as there were 4,500 foot passengers for whom there are no foot paths, the danger to life is very great and many accidents occur.

The newspaper has been projected by RE Park as one of the hallmarks of modern urban life. It is, in his words, "The great medium of communication within the city, and it is on the basis of the information which it supplies that public opinion rests. The first function which a newspaper supplies is that which formerly was performed by the village gossip".187 In Bombay during the 1830s and 1840s there had been a steady rise in the number of newspapers published from the city. By 1851, 29 newspapers were being published in four languages - English. Gujarati, Marathi and Persian:

Finally, there was the seamier side of Bombay. Petty crime in the city was the obverse of a flourishing commerce in opium. J P Grant, judge of the King's Court in Bombay, delivering an address in 1828 stated that, "Daring robbenes are perpetrated within the walls of the fortified town by gangs goods are conveyed to the ramparts and lowered down by ropes attached to the guns of the fort".188 Crime had brought with it a police force. Bombay in the 1830s had a senior magistrate, a junior magistrate, a superintendent of police and a high constable. There were three police divisions - Fort, Byculla and Mahim - each with a head constable.184

This police force, along with the judiciary, became the instrument for safeguarding bourgeois property against pilferage and theft. Punishment was harsh: confinement, banishment, torture. In the Petty Sessions "the infliction of punishment by rattan" was "a very common sentence" during the 1820s. 190 Lashing was "ottended with extraordinary severity, drawing blood at every stripe, and sometimes taking off with it small pieces of flesh". 191 While upper class Indians served on juries or were appointed justices of peace, the poorer sections were the victims of such brutal methods of punishment. The scars caused by lashing which were "never obliterated but by death" could be observed "on many a native as he toils along the streets of the town under the burden of a palanquin".192

Magistrates exercised their authority most arbitrarily, carrying terror "into the poorest hovel by his peons dispersed over the island". 193 Appeal against such arbitrariness was not easy. In a Kafkaesque episode, "on the October 6, 1817, a man ... was sentenced to hard labour till he should find securities. Under this sentence he remained in jail till

#### **Appendix**

The pattern of Bombay's intercourse as it had developed by the beginning of the 19th century is perhaps best illustrated by the contrast between the situation in Bombay on the one hand and the Deccan and Konkan on the other during the famine of 1803." While shortages overtook the Deccan and Konkan, Bombay was in a position to support a growing population which flocked to the city to seek food and employment there in the wake of the famine. A perusal of records pertaining to this period, especially for the year 1804, leaves one in no doubt that by the early 19th century Bombay had an extensive sea-borne trading network for supply of grain to it. The Konkan was one of the major sources for the supply of grain to Bombay by the middle of the 18th century. However, Bombay's connections permitted it to tap alternative sources further afar with the help of a merchant class capable of handling a considerable trade in grain. This merchant class already included a number of Indians trading on their own account.

It is not surprising that Forbes and Company and Bruce, Fawcett and Company should have been at the forefront of those who contracted to supply grain to Bombay during the famine. These two firms had been in existence since the last quarter of the 18th century and worked in close alliance with each other during the early 19th century.4 Their connections and influence with the Bombay government are well known. They were therefore able to wangle several tenders for providing grain to Bombay. We know that in 1804 Forbes and Company had got at least one contract for 10,000 bags of rice (1 bag = 168 lbs) to be shipped from Bengal. In August 1804 a lengthy correspondence ensued between Forbes and Company, Bruce. Fawcett and Company, and some other firms and the Bombay government over the question of raising the price of rice originally stated in their tender. Initially, these firms had undertaken to supply rice at Rs 7 per bag. In August 1804 the Bombay government agreed to a price of Rs 9 per bag, though merchants kept grumbling that the price might rise to over Rs 12 per bag.h It was reported that the prices at Calcutta had been going up due to increase in demand at Bombay,' which is significant being indicative of a certain orientation of the market. Sea-borne trade made the economic

integration of Bombay with Calcutta much easier. The cost for transporting grain from Calcutta to Bombay was estimated to be four rupees per bag, for a ship-load of 10,000 bags. Among the Indian merchants involved in this trade we have reference to Nasserwanjee Manockjee of Bombay who had been commissioned by Dorabjee Byramjee of Calcutta to dispose 29,000 bags of rice. Nasserwanjee Manockjee's name appears in the Bombay Directory of 1792 as one of the prominent merchants of the 'Persic Caste'.

Not without reason then a large number of people sought refuge in Bombay, where food was more easily available as was some sort of poor relief and employment through public works like road construction." Of course, typically capitalist vices like speculation in foodstocks and adulteration were very much in evidence "

#### Notes

- (a) Among the causes of the Great Famine of 1803 in the Konkan was the partial failure of rains in 1802 and a more complete failure in 1803 See Campbell, Materials, Vol III, p 522. It might also be worth exploring a possible connection between colonial intervention and the famine.

July 1823, a period of six years, when he died in jail". 194

Michel Foucault speaks of the "severe repression of illegality", out of all proportion to the offence, in bourgeois society: "The development of ports, the appearance of great warehouses in which merchandise was stored, the organisation of huge workshops... also necessitated a severe repression of illegality. The way in which wealth tended to be invested, on a much larger scale than before, in commodities and machines presupposed a systematic, armed intolerance of illegality". 195

The development of capitalism in Bombay was thus equipped to protect bourgeois property against petty-crime while, in a world of topsy-turvy morality, colonial and indigenous enterprise operating from the city merrily peddled opium to the Chinese.

- 21 Details of the early colonial history of Bombay are fairly well known. Suffice it to say that the 'Vasco da Gaina era' of its history began with the arrival of the Portuguese at the island in 1509 and the establishment of their authority over it in 1534. The Portuguese made over Bombay to the British under provisions of the treaty of 1661 concluded on the occasion of the marriage of Charles II of Great Britain and Catherine Braganza of Portugal. The British crown managed to eventually get actual possession of the island in 1665, and in turn

- passed it on to the East India Company, for token Ponds 10 annual rent.
- 22 Das Gupta, Decline of Surat, p 8.
- 23 Cf Gokhale, Surat in the Seventeenth-Century, p 73.
- 24 The answer to this question is not necessarily easy or obvious. If, for instance, we regard the decline of Surat, in the words of David" Hardiman, as being "bound up with the" increasing penetration and control of india's external trade by European powers in the period after 1500" it might be possible to see the rise of Bombay as a triumph for British enterprise along the western coast. (David Hardiman, 'Elite Conflicts in a Trading Empire', Review of Das Gupta, Indian Merchants and the Decline of Surat. EPW, Vol XVI, No 50, December 12, 1981, p 2039). In the case of Surat one is not entirely convinced that European penetration had indeed become decisive in the early 18th century Das Gupta in a rejoinder has provided evidence indicating that in this period "European companies at Surat carried no more than one-eighth of the city's maritime commerce" (Ashin Das Gunta, 'Indian Merchants in the Age of Partnership, 1500-1800', Dwijendra Tripathi (ed), Business Communities of India A Historical Perspective, New Delhi, 1984, p.30). It does appear that Gujarati commerce, especially with west Asia, was able to withstand the European onslaught till the beginning of the 18th century Gujarati resilience has to be seen in terms of the strong presence of the Ottoman. Safavid and Mughal empires, the crisis at Surat beginning with the decline of these three empires around the turn of the 18th century.

## The United Nations, the US and Northern Iraq

#### **Ninan Koshy**

The dominance of the US in the security council led to the interpretation and implementation of the resolution 688 according to the US objectives, and a clear manipulation of UN processes including post-facto legitimisation by the UN of US actions. The overriding motive behind the US intervention in Iraq was not assistance to the Kurds, but maintenance of the gains of the Gulf war and the assuagement of public opinion in the west.

WHILE it is generally agreed that the recent missile attacks by the US on Iraq are a flagrant violation both of international law and Iraqi sovereignty it is not often recognised that practically all US actions in northern Iraq since 1991 are in contravention of international norms. A close examination of US actions and UN resolutions will show that the US and its allies deliberately misinterpreted UN resolutions to suit their plans, manipulated UN processes to attain their objectives, took actions in the name of the UN without authorisation and managed to obtain subsequent legitimisation by the UN in some instances.

We attempt here an analysis of security council resolution 688 which is frequently quoted by the US as the basis for its actions with regard to northern Iraq. The commander of the US naval forces in the Gulf claimed that the recent strikes against Iraq were meant as a warning to adhere to requirements outlined in the UN security council resolution. Secretary of State Warren Christopher said in Paris on September 5 that "importance of a no-fly zone was generally agreed to be a good way to carry out UN Resolution 688".

The security council of the UN at its 298th meeting on April 5, 1991 adopted resolution 688, condemning "the repression of the Iraqi population in many parts of Iraq, including most recently in Kurdish populated areas, the consequences of which threaten international peace and security in the region". The resolution outlined a series of measures to be undertaken by the Iraqi government and by the UN.

The resolution was an innovation and unprecedented. It clearly departed from the traditional interpretation of Article 2, paragraph 7 of the UN charter regarding non-intervention "in matters which are essentially within the domestic jurisdiction of any state". There were other elements also in the resolution which reflected a clear departure from previous practices of the security council.

#### THE BACKGROUND

'Operation Desert Storm', launched against Iraq for its invasion of Kuwait, was halted by the US president on February 27, 1991, at midnight. After less than five days of heavy ground warfare which followed hi-

tech aerial bombardment from January 16, 1991, the coalition forces led by the US had not only pushed Iraq out of Kuwait but occupied more than 15 per cent of Iraqi territory

In the wake of the devastating defeat of the Iraqi army, revolt against the Iraqi regime first erupted in southern Iraq and soon spread to the Kurdish populated region in the north. Kurdish forces were briefly in control of Arbil, Sulamaniyah, Dahok, Zakho and neighbouring towns. As government forces began to recapture these towns and cities, a mass exodus of Kurdish population began. By the end of March, it was estimated that over one million Kurds had fled to Iran, while hundreds of thousands headed towards the Turkish border, to escape the aerial and ground bombardment by Iraqi military forces.

Thus, one of the largest mass exoduses in recent history took place. The television pictures of hundreds of thousands of Kurds seeking refuge in the mountains in the winter, dying, destitute and dehydrated, forced international action. The pictures were politically uncomfortable and strategically inconvenient to the coalition states, especially the US. To them, it appeared that the gains of the war were being lost in the mountains bordering Turkey and Iraq. In several western nations, there were demands for action.

Some observers trace the uprising in the southern and northern parts of Iraq to a statement made by president Bush at the height of the war. In remarks made to the American Academy for the Advancement of Science he said: "But there's another way for the bloodshed to stop, and that is for the Iraqi military and the Iraqi people to take matters into their own hands to force Saddam Hussein, the dictator, to step aside and to comply with the UN and then rejoin the family of peace-loving nations".3 It is true that the president did not explicitly promise coalition support to any rebellion but it is quite conceivable that at least some sections of those who rebelled expected such support.4

In addition to the immense pressure from the public of many western countries, intensified by media exposure of the suffering of the Kurdish population, the US had to deal with the pressure from Turkey, whose support to the US was crucial in the war against Iraq. It was true that with the sudden influx of such a large number of refugees, Turkey was facing a massive humanitarian problem. It was also important for Turkey to try to contain the Kurdish problem in Iraq without further complicating its own problems with the Kurds in Turkey. It however, realised that this would not be easy.

Western nations felt that the UN had a special responsibility as the situation in the Kurdish region developed directly as a result of a UN-sanctioned war. It appeared that further action against Iraq would fit into the scheme of things and the series of actions initiated by the security council from August 1990, and that the continuation of punitive action against Iraq would have general international support. It is this context that made it possible for the security council to adopt resolution 688.

#### THE RESOLUTION

It is not clear under which provisions of the UN Charter this action of the security council was taken. The reference to "the consequences of which threaten international peace and security in the region" might give the impression that the action was taken under chapter VII of the charter. But a closer reading of the resolution leaves one with the impression that the security council did not want to refer to any particular provision of the charter under which it was acting. In fact the only reference to the charter in the resolution is Article 2(7) which is a negative one prohibiting the UN from intervening in matters which are essentially within the jurisdiction of any state.

The security council acted on the basis of letters from representatives of Turkey, France and Iran. The three letters underlined the magnitude of the suffering of Iraqi refugees, the international character of the crisis and its consequences for regional peace and security. On the other hand a letter from the permanent representative of Iraq to the UN addressed to the secretary-general had alleged that certain circles within the security council were taking actions "aimed at disrupting the internal security" of the country. Iraq thus maintained that the revolt by the Kurds and the Shiites was instigated from outside."

In addition to the recalling of Article 2. paragraph 7 of the charter, the preambular part of the resolution went on to "reaffirming the commitment of all member states to the

sovereignty, territorial integrity and political independence of Iraq and of all states in the area".

As mentioned earlier the resolution was unprecedented. There was no previous instance where the security council had condemned in such language the domestic policies of any government. While the security council attempted to maintain that its concern was with the repercussions of the Iraqi government's action for international peace and security in the region, it condemned "the repression of the Iraqi civilian population in many parts of Iraq, including most recently in Kurdish populated areas". It demanded Iraq "immediately end this repression". The 'insistence' that 'Iraq allows immediate access by international humanitarian organisations" was different from the generally accepted principle of consent regarding international assistance to affected populations within a state.

The resolution gave a rather vague mandate to the secretary-general in requesting him "to use all the resources at his disposal". It was not clear what kind of actions the secretary-general was expected to carry out or what the resources were. Statements by some member states later indicated that they had different kinds of expectations from the secretary-general. The secretary-general himself referred to this lack of clarity later in the year in his report to the general assembly.

It is important to point out that resolution 688 did not refer to the Kurds as a people. nationality, group or minority. The reference is only "to the Iraqi civilian population in many parts of Iraq, including most recently in Kurdish populated areas". It was known that earlier drafts of the resolution did refer to the Kurds as a group and that such reference was omitted because of objections from Turkey. Apparently, Turkey did not want a recognition of Kurdish identity in Iraq or in Turkey. In effect, the security council does not admit that it is acting with specific reference to the human rights of the Kurds. Even in the part of the resolution which expresses the hope for an open dialogue, it is in order to "ensure that the human and political rights of all Iraqi citizens are respected". Of course, it may be argued that "all Iraqi citizens" include the Kurds but that does not hide the fact that the omission of specific reference to the Kurds was deliberate. This lack of specific reference to the Kurds as a group and to their rights is specially noticeable when the Iraqi constitution and laws themselves recognise Kurds as a minority group and refer to the region as Kurdistan.10

The debate in the security council on the draft resolution and the statements made subsequent to its adoption became in effect a discussion on interpretation of two

significant aspects of international law: 'International peace and security' and 'intervention in the internal affairs of a state'.

But for the fact that events in Iraq took place in the aftermath of the Gulf war and that the UN security council had taken a series of measures against Iraq, including resolution 687 on the cease-fire adopted on April 4, the debate would have taken a different turn. There was a general mood of condemnation of Iraq in the UN from the time of the Iraqi invasion of Kuwait. It was difficult to discuss principles without appearing to condone or condemnate actions of the Iraqi leadership. The majority of the security council appeared to agree that Saddam Hussein should be punished.

There were 10 votes in favour of the resolution, three against and two abstentions. Cuba, Yemen and Zimbabwe voted against the resolution. China and India abstained. Different sets of arguments were put forward by those in each category.

Those who supported the resolution argued that developments in Iraq were a threat to regional peace and security; an internal development of gross violation of human rights which deserved UN intervention and action.

Turkey, Iran, the US and the USSR gave emphasis to the 'peace and security' argument to show that the action was well within the competence of UN. Turkey spoke of the "grave threat to the peace and security of the region posed by the tragic events taking place in Iraq". Iran maintained that "the situation inside Iraq, due to its gravity and implications for the neighbouring countries. has consequences that threaten regional and international peace and security". The US argued that the council was addressing the transboundary impact of Iraq's treatment of its civilian population which threatened regional stability. The USSR felt that "the Iraqı situation was creating a destabilising situation in the area and posing the threat of a new international conflict".12

Among those who supported the resolution France, Germany and the UK gave emphasis to the violation of human rights by the Iraqi regime. France referred to the threat to international peace and security in the region but clearly the emphasis was on the internal situation of Iraq. It was chiefly concerned about the responsibility of the UN in the protection of human rights. According to France, "violations of human rights such as those now being observed become a matter of international interest when they take on such proportions that they assume the dimension of a crime against humanity". Germany maintained that the Iraqi government actions "harbour the danger of genocide".13

The argument by the representative of the UK deserves special mention. He challenged the argument that "this action is in some way

outside the scope of the security council, that it is an entirely internal matter". His delegation could not accept that argument. The UK representative gave his interpretation of Article 2, paragraph 7. He said, it "does not apply to, matters which, under the charter, are not essentially domestic and we have often seen human rights - for example in South Africa - defined in that category". This implied that human rights are not essentially under domestic jurisdiction and the actions of the security council on South Africa set a precedent and indicated an expanding jurisdiction on human rights. According to the representative of the UK, the threat to international peace and security was a consideration which came only after the issue of violation of human rights in Iraq. The primary issue was human rights.14

This of course adds an important dimension to the debate. South Africa was treated as an exceptional situation in view of its policies of 'apartheid' condemned by the UN. Citing it as a precedent for action with respect to internal policies of governments and arguing that human rights do not come under the domestic purisdiction of states, would imply that the UN is entitled to intervene in a number of instances. It was not clear whether the UK representative was prepared to follow through the argument to other situations of violations of human rights and ask for action by the UN security council.

It is significant to note that most of those who spoke in favour of the resolution made reference to the preamble of the resolution recalling Article 2, paragraph 7 of the charter, as if a reaffirmation of that would be enough justification for any action by the security council

Those who spoke against the resolution based their arguments squarely on this very article. Yemen, Zimbabwe and Cuba maintained that the matter was part of the essential internal jurisdiction of Iraq and that the UN therefore had no competence to act. They argued that it was not within the council's purview to address internal issues in any country and that it was the first departure from the rule of maintaining a strict focus on the council's responsibilities under the charter. Cuba added the argument that questions of a humanitarian nature do not belong to the security council but to the general assembly and therefore the proper procedure would be to convene the general assembly.15

The two countries which abstained were India and China. They were apparently not convinced that there was a clear threat to international peace and security. They maintained that the security council should not consider or take action on questions concerning the internal affairs of any state. 16

The debate in the security council generally reflected the positions of members on UN

actions on Iraq from the time of its aggression against Kuwait. The US, the UK and France were members of the coalition which took military action against Iraq. Germany had all along joined the other western members of the security council in its actions against Iraq. The Soviet Union also had regularly supported the US in the security council. The new international situation had not only brought the US and the Soviet Union closer but had actually made the Soviet Union dependent on the US for economic assistance. The Soviet Union had already lost its leverage in international affairs.

Yemen and Cuba were consistent in their opposition to the actions against Iraq. Yemen was one of the few supporters of Iraq in the Arab world. Cuba generally upheld positions which would have been in the past voiced in the UN by the Soviet Union and members of the non-aligned movement. Countries like Zimbabwe were under considerable pressure from the US during the discussion on Iraq. Zimbabwe had supported earlier actions of the security council. But it felt that resolution 688 was inconsistent with the clear parameters of the council's competence as provided for in the charter.

India had become a member of the security council only in January 1991. Its arguments in the council seemed to indicate that it would have preferred to oppose the resolution. It was not however prepared to displease the US to such an extent in view of a number of important negotiations on economic issues in which the role of the US was crucial. It is known that India has been wary of the apparently expanding international jurisdiction of the UN especially with regard to human rights and internal conflicts. It was particularly concerned about international spotlight being focused on Kashmir. India's positions in the security council during 1992-94 deserve further scrutiny as they seem to reflect the fragmentation of the consensus in India's foreign policy. The views expressed by China showed that it was clearly against the resolution. But instead of opposing it and thus vetoing it, China abstained as it had done on the earlier resolution 678 which authorised the use of force against Iraq. It has to be pointed out that China very rarely uses its veto power in the security council Like India, China also had an 'internal problem' often eliciting international attention, viz, Tibet. So it really did not want to create a precedent for UN intervention in internal matters. But it was not willing to displease the US because of economic and other considerations.

#### INTERPRETATION AND IMPLEMENTATION

It was apparent from the subsequent actions of some member states and the UN itself that the resolution was interpreted in various ways. There seemed to be differing expectations about actions by the UN in implementing the resolution. Some states undertook actions whose conformity with the resolution was in serious doubt. In general, the interpretations and actions broadened the scope of the resolution. But more than that, these interpretations and actions linked the resolution to other actions of the security council on Iraq and made it part of a package of sanctions against Iraq.

In an earlier section, the vagueness of the mandate given to the secretary-general in the resolution was referred to. This led to some states having expectations from the secretary-general which he did not feel were consistent either with his powers or the resolution.

In the security council debate on resolution 688, the representative of Germany linked it to the resolution on cease-fire (security council resolution 687 laid down conditions for the cease fire). According to him resolution 688 was a follow-up of the ceasefire resolution. It could be argued that several elements of the cease-fire resolution already constituted intervention in the domestic jurisdiction of Iraq and that it was possible to take action in the case of Kurds only because it was in the aftermath of the war and because the cease-fire resolution contained various actions which curtailed the military power as well as the military activities of Iraq. However, two things deserve mention; in the cease-fire resolution there is no reference to human rights of people in Iraq or to domestic policies of the government; while the resolution provided further ground for continuing economic sanctions it did not refer to renewed military action. As pointed out earlier resolution 688 does not refer to resolution 687 in its text. However, in the actions by some meinber states and the UN, resolution 688 became increasingly linked to the cease-fire resolution and its enforcement measures

The proposal by the British prime minister, John Major for the establishment of a 'safe haven' for Kurdish refugees was on the basis of such a link. At a press conference at Luxembourg on April 8, 1991, after the meeting of the European Community (EC), he said that at the meeting he had put forward an action plan of four main points "that are intended to build on security council resolutions 687 and 688". The first referred to "a generous community contribution to the international appeal which has also been launched today by the Secretary-General of the UN". "The second suggestion was to propose the establishment of a safe haven in northern Iraq under UN control where refugees, particularly Kurds, although there would be some of course who would not necessarily be Kurds, would be safe from attack and able to receive relief supplies in a regular and in an orderly way". The third proposal wa that "sanctions must remain in force until Saddam Hussein's offer of an amnesty is made permanent and the persecution of the Iraqi Kurds ceases". "Fourth, I proposed to colleagues a total embargo must be maintained on Saddam Hussein's Iraq for as long as he remains in power". "7 The meeting of the EC agreed to all these points.

The proposal for the establishment of a 'safe haven' in northern Iraq "under UN control" was made without any prior discussion in the security council or with the secretary-general. In making the four proposals the prime minister claimed that he was 'building on' resolutions 687 and 688. He thus not only linked the two resolutions but was ready to go beyond them. He linked sanctions explicitly to the treatment of Iraqu Kurds though there was no basis for such a link in the security council resolutions. He added a new condition to lift embargo, and said that total embargo should be maintained for as long as Saddam Hussein remained in power. There was no basis for this in any UN actions. Statements by the prime minister seemed to indicate that he assumed that 'safe haven' could be established under UN control without any further action by the security counci!.

It was president Bush who followed up the proposals of prime minister Major. He was apparently more knowledgeable about UN procedures than the British prime minister, and realised that the proposal for 'safe haven' was on shaky ground. On April 16, president Bush, following consultations with (British) prime minister Major, (French) president Mitterrand, president Ozal of Turkey, (German) chancellor Kohl and UN secretary-general Perez de Cuellar, announced at a press conference, "consistent with the UN security council resolution 688. I have directed the US military to begin immediately to establish several encampments in northern Iraq where relief supplies for these refugees will be made available". He added that "adequate security will be provided at these temporary sites by US, British and French air and ground forces again consistent with UN security council resolution 688".18

The president was at pains to show that the establishment of 'safe haven' under the protection of the coalition troops — not 'under UN control' as prime minister Major had originally proposed — was consistent with resolution 688. He did not mention which part of the resolution he was referring to. He added, "We intend to turn over the administration of and security for these sites as soon as possible to the UN. The UN forces will be coming down into the south — the Blue Helmets — and it may require for a UN peacekeeping force in there or UN Blue Helmets, a new resolution from the security

council. And that is a complicated problem, given the fact that some of the members who were steadfastly with us in the coalition might have problems with something of the nature". 19

ř

The decision to establish a 'safe haven' was made by the western nations. This was clearly an invasion of Iraqi sovereignty. The claim that it was consistent with resolution 688 cannot be sustained. It was also the western nations which announced without any discussion in the security council that the UN will take over the responsibility of the 'safe haven'. In a letter dated April 21, 1991 from the minister of foreign affairs of Iraq addressed to the secretary-general of the UN, the Iraqi government took serious objection to the entry of armed forces of the US and other countries in northern Iraq "since it would constitute serious, unjustifiable and unfounded attack on the sovereignty and territorial integrity of Iraq".

Bush was knowledgeable enough about UN procedures to realise that a new security council resolution could be required to send any UN troops. He also knew that it would be difficult to get such a resolution adopted. His attempt was therefore to legitimise by the UN the sending of coalition troops without going through the process of a new action by the security council.

While president Bush did not directly link resolutions 687 and 688, he was apparently ready to give a generous interpretation of resolution 688. On this he had agreed with the EC. They were ready to bend the rules to suit their plan. After a European Economic Community consultation with secretary Baker on April 17, 1991, Luxeinbourg foreign minister Jacques Poos said: "The Twelve and the US also agree on interpreting in an extensive manner resolution 688 regarding the protection of the security camps inside. Iraq. itself". 21

The joint statement by secretary James Baker and Turkish foreign minister Ahmet Iptemocin, on April 8, had already linked resolutions 687 and 688. The statement said, "the plight of these refugees – as the security council resolution says a threat to international peace and security – has thus become another important issue in the full implementation of the cease-tire resolution". As pointed out earlier nowhere in the cease-fire resolution is any reference to human rights in Iraq or the domestic policies of Iraqi government or to the refugees. Nor is there any reference to any of the earlier resolutions in resolution 688.

A link between resolution 688 and the cease-fire resolution was made also by US assistant secretary for Near Eastern and South Asian Affairs, John H Kelly, in a statement before the sub-committee on Europe and the Middle East of the House Foreign Affairs Committee, Washington, DC on June 17.

1991. He said that "behind UNSC resolution 688 are the enforcement provisions of 687 dealing with conditions to alleviate sanctions and reparation". This was a deliberate misinterpretation of resolution 688.

A proposal by the executive delegate for the UN inter-agency humanitarian programme made in his report of July 15, 1991 also linked of resolution 688 to the sanctions policy of the UN against Iraq. Resolution 706 adopted by the security council on August 15, 1991 made financing of the UN humanitarian operations including those for the Kurdish population contingent upon Iraq's compliance with the cease-fire resolution and part of the package of sanctions against Iraq. This diminished substantially the humanitarian value of resolution 688

Iraq did not accept resolution 688. However subsequent actions by the Iraqi government show that Iraq complied with some of the provisions of the resolution

From April 13-18, the UN mission led by Eric Suy, personal representative of the UN secretary-general, and from April 16-18, the UN inter-agency mission led by Prince Sadruddin Aga Khan, executive delegate of the UN secretary-general for the UN humanitarian programme for fraq, Kuwait and Iraq/Iran and Iraq/Turkey border areas visited fraq. The fraqi government cooperated with both the missions.

The discussions between the UN and the leaque government became difficult at one stage as a result of statements and actions by prime minister Major and president Bush. A Memorandum of Understanding (MoU) was signed on April 18, 1991 by Ahmed Hussein, minister of foreign affairs of Iraq and Sadruddin Aga Khau, executive delegate of the UN secretary-general. In the MoU, the Iraqi government pledged "its fall support to and co-operation with the UN and its

specialised agencies and programmes" in the efforts to promote the voluntary return home of displaced persons. The government of Iraq agreed to the "establishment of UN sub-offices and Humanitarian Centres (UNHOCs)". The memorandum also provided for "routes of return with relay stations along the way as well as logistic back-up capabilities". A further agreement was made between the government of Iraq and the UN for the deployment of a UN guards contingent within the framework of the MoU."

In general the memorandum covered all the humanitarian aspects in the resolution. The demand that "Iraq co-operate with the secretary general on humanitarian efforts" was in a large measure complied with at least initially. On the political aspects, the security council had expressed the hope "that an open dialogue will take place to ensure that the human and political rights of all Iraqi citizens are respected". The Iraqi government held a series of discussions with representatives of Kurdish movements regarding autonomy of the Kurdish region and democratic reforms in Iraq as a whole. These talks were not successful and have to be seen against the background of such discussions and the developments in the Kurdish region from the late 1960s. The Iraqi government was perhaps neither serious nor sincere about these talks. The Kurdish leaders were not yet ready to trust Saddam Hussein

It may be argued that rather than the security council itself, it was the action by members of the council who utilising of the resolution contravened article 2 paragraph 7 of the charter. But it was in the name of the UN. The creation of 'safe haven' utilising the resolution violated the principle of domestic jurisdiction. The legitimisation of this by the UN thus constituted a flouting

## CENSUS AS SOCIAL DOCUMENT

S.P. Mohanty & A.R. Momin (Eds.)

The papers included in this volume cover a wide spectrum of themes relating to the census. These include an appraisal of economic data relating to working population, an analysis of occupational diversification and urbanization, poverty-induced migration, the aging population and its economic activities and a review of the demographic situation of the tribal population.

3-Na-20, Jawahar Nagar, JAIPUR 302004 Phone: 0141-651022 Fax: 0141-651748 of the principle. The military operations undertaken by the US, the UK and France was by any standards intervention in the affairs of a sovereign country, though ostensibly for humanitarian reasons. The establishment of 'no-fly zones' in the north and south of Iraq was not endorsed by the UN.

#### A HUMANITARIAN INTERVENTION?

At the press conference on April 16, 1991 when president Bush announced the sending of coalition troops to northern Iraq he said, "And some might argue that this is an intervention into the internal affairs of Iraq. But I think the humanitarian concern is so overwhelming that there will be a lot of understanding for it". 28 The president was not exactly saying that it was not intervention. He said this would be justified under the circumstances as humanitarian intervention.

Two examples usually cited as justifiable humanitarian interventions are India's intervention in East Pakistan and Tanzania's intervention in Uganda. But even they do not go unchallenged. It would be argued that both these interventions were hardly disinterested, and motives other than humanitarian ones prevailed

After arriving at the conclusion, on the basis of analysis of several cases, a 'blanket prohibition of humanitarian intervention' is "neither mandated by law, nor is it desirable on policy considerations". Ved P Nanda offers the following criteria to evaluate the permissibility of intervention on humanitarian grounds:

- 1 The severity of the rights violations the necessity criterion (a) genocide, (b) gross, persistent and systematic violations of human rights.
- 2 The nature of the intervention the proportionality criterion (a) duration, (b) was the lorce proper/excessive?
- 3 The purpose of the intervention (a) humanitarian concern?, (b) self-interest, (c) mixed?
- 4 Was the action collective or unilateral?
- 5 Balancing alternatives and outcomes (a)
  Does the intervention maximise the best outcomes?<sup>179</sup>

The military intervention in northern Iraq by the US and its allies may be examined with the above criteria. There was no doubt about the severity of the human rights violations of the Kurds and others in northern Iraq. However the actual intervention was only after the worst excesses were committed by the Iraqi forces. It may be conceded that the force used was not excessive. The motives were obviously mixed. There was the humanitarian concern but that was subservient to domestic political interests of western nations, strategic objectives in the region and the interests of Turkey. The overriding motive was the compulsion to

pursue the actions against Saddam Hussein and therefore the intervention became part of a package of punitive measures against Saddam Hussein. While the US and its allies did not directly support the Kurdish rebellion, statements by president Bush and prime minister Major reflected their intention to see Saddam Hussein removed from power. The intervention though on humanitarian grounds was a continuation of the sanctions policy against Iraq and it was announced that the sanctions would continue as long as Saddam Hussein remained in power.

The action was collective only to the extent that the military forces of the US, Great Britain and France were used. It was presented as a collective action of the UN but this was clearly a case of legitimisation of actions initiated by the US and its allies. The creation of 'safe haven' sending of the coalition troops and 'no-fly zones' were not authorised by the security council and the link established between resolutions 688 and 687 (on cease-fire) had no basis. The US and its allies pursued actions primarily in their self-interest and made use of the UN for the cloak of legitimacy. The concept of 'safe haven' might have become significant as a precedent but for the manner in which it was created. The security council was not asked to authorise or endorse the protective measures in the safety zones, presumably because not all of the permanent members were prepared to support them. The absence of explicit security council endorsement, together with the basic charter provision against intervention in matters essentially within domestic jurisdiction, was cited by dissenting UN members as grounds for condemning the use of troops in the safety zones as charter violations of serious import. All states, it was argued, had reason to fear the effect of that precedent. The case would have been different if the troops were sent under the auspices of the UN.

#### SOME CONCLUDING OBSERVATIONS

The UN security council resolution on northern Iraq was unprecedented. It was made possible only as a result of a series of earlier actions against Iraq. It broke tradition both in the content and the tenor of the resolution. It followed the cease-fire resolution which in various aspects was a direct intervention in the internal affairs of Iraq. Resolution 688 was enforced the way in which it was done because it was linked to the cease-fire resolution, though such a link was uncalled for and resolution 688 did not contain enforcement measures. The cease-fire resolution was in the form of conditions imposed on the vanquished by the victor in a war and that attitude of the security council was reflected in the implementation of the resolution on the situation in northern Iraq also.

## CONCEPT A RICH DOCUMENTION

### **UTTARAKHAND**

Past, Present and Future

J. C. AGGARWAL and S. P. AGRAWAL

Hardbound Rs. 750

The book attempts to study the demand for the creation of Uttarakhand State in the historical perspective of integration of princely states and formation and reorganisation of states and Union Territories. The book also includes a comprehensive bibliography on Uttarakhand.

- J. C. Aggarwal is former Deputy Director of Education/Executive Director of Delhi Bureau of Textbooks, Delhi Administration.
- **S.P. Agrawal** is Former Director, National Social Science Documentation Centre (ICSSR).

possible because of the new dynamics in the security council at the end of the cold war. The US virtually dominated the security council and the challenge from the Soviet Union to the US which had existed for four decades had come to an end. In fact the Soviet Union became dependent on the US. The western nations followed the leadership of the US. The developing nations were too weak to oppose the US and even China was not ready to displease the US because it needed the US support for economic and trade benefits.

This dominance of the US in the security council made the objectives of intervention in Iraq subservient to the US objectives in the region, conditioned very much by the Gulf war, This also led to the interpretation and implementation of the resolution according to the US objectives and a clear manipulation of UN processes including post-facto legitinisation by UN of the US actions. The overriding motive for the US was not assistance to the Kurds but the maintenance of the gains of the Gulf war and the assuagement of public opinion in the west.

It can be pointed out that the action by the US through UN and the manner in which it was carried out was very much influenced by Turkey After the collapse of the Soviet Union, it was at a time when a new rationale had to be found for the US's need for Turkey that Iraq invaded Kuwait. It was therefore natural that the US gave more importance to the interests of Turkey than those of Iraqi Kurds. Turkey's record of human rights violations of Kurds in Turkey often matched that of Iraq and was in many ways even more deplorable. It was in the interests of Turkey which has a much Kurdish population than in Iraq not to recognise any Kurdish identity. The lack of reference to the Kurds as a people or group diminished the human rights aspect of the resolution.

The statement by the foreign minister of Zimbabwe in the security council meeting at the level of heads of governments in January 1992 is relevant here.

In the era we are entering the Council will be called upon to deal more and more with conflicts and humanitarian situations of a domestic nature that could pose threats to international peace and stability. However, great care has to be taken to see that these domestic conflicts are not used as a pretext for the intervention of the big powers in the legitimate domestic affairs of small states or that human rights issues are not used for totally different purposes of destablising other governments. There is, therefore, need to strike a delicate balance between the rights of states, as enshrined in the charter and the rights of individuals, as enshrined in the Universal Declaration on Human Rights. Zimbahwe supports very strongly both the Universal Declaration and the CHARGE OR DIESE ISSUES: AIMOROWE IS B HITM subscriber to the principles in the UN Declaration on Human Rights. However, we cannot but express our apprehension about who will decide when to get the security council involved in an internal matter and in what manner. In other words, who will judge when a threshold is passed that calls for international action? Who will decide what should be done, how it will be done and by whom? This clearly calls for a careful drawing up and drafting of general principles and guidelines that would guide decisions on when a domestic situation warrants international action, either by the security council or by regional organisation. 10

#### Notes

- 1 UN Documents, S/RES/688, 1991
- 2 UN Charter Article 2(7), "Nothing contained in the present charter shall authorise the UN to intervene in matters which are essentially within the domestic jurisdiction of any state or shall require the members to submit such matters to settlement under the present charter, but this principle shall not prejudice the application of enforcement measures under chapter VII"
- 3 Financial Times, London, February 16, 1991.
- 4 The US administration probably weighed such support but apparently decided against it. As a staff report to the committee on foreign telations of the US senate on the civil war in Iraq states, "As the anti-Saddani rebellion gained force in March, several strategically located Iraqi military figures contacted principals in the joint action committee according to both Arab and Kurdish opposition leaders. As the Iraqi military figures contemplated bringing possibly decisive force to the side of the rebels, they looked for a sign that the sponsors of the rebellion had the support of the US, the one country pre-eminent militarily and politically in Iraq. No such signal was given" (Staff Report to the Committee on Foreign Relations, US Senate, May 1991, p 15)
- 5 Resolution 688 does not refer to any of the previous resolutions on Iraq. These included among others, resolutions condemning the Iraqi invasion of Kuwait (resolution 660 of August 2, 1990), authorising states in alliance with Kuwait to use all necessary means to ensure the withdrawal of Iraq from Kuwait (resolution 678 of November 29) and laying down conditions for cease-fire (resolution 687 of April 3, 1991)
- 6 Chapter VII of the Charter is on "action with respect to threats to the peace, breach of the peace and acts of aggression".
- peace and acts of aggression".

- 8 UN Documents S/22440, April 3, 1991
- 9 UN Documents S/RES/688, 1991.
- 10 According to the constitution of Iraq, "The Iraqi people is composed of two main nationalities, Arabs and Kurds The constitution confers the nationalities rights of the Kurdish people and the legitimate rights of all other minorities within the framework of Iraqi unity". The country is divided into 15 provinces and three autonomous regions including the Kurdish autonomous region.
- 11 The cease-fire resolution (resolution 687) laid

- demolition of weapons of mass destruction and nuclear weapons capacity.
- 12 UN Documents S/PV 2982, April 5, 1991.
- 13 Ibid.
- 14 Ibid
- 15 Ibid The Cuban representative said, "If it is felt that the international community should show conc⊕n for the humanitarian aspects of a question, then the security council has no right to do so in a way which the Charter specifically precludes". According to him the powers of the security council did not include questions of a humanitarian nature
- 16 Ibid. The Indian representative said, "Only where such conditions, including indiscriminate use of force, result in a clear threat to international peace and security would it be within the competence of the security council to address the issue... We believe that the Council should have concentrated on the aspect of peace and security, which is its proper mandate under the Charter, and left the other aspects to other, more appropriate organs of the UN".
- 17 Foreign Policy Bulletin, Washington, May/ June 1991, p 19-20
- 18 Ibid, p.21. The statement by the president that his action was in consultation also with the secretary-general is to be taken as another instance of the US using the UN and seeking legitimacy of its actions. In view of the fact that there was no security council endorsement of 'safe haven' this also raises questions about the role of the secretary-general.
- 19 lbid, p 21-22. President Bush knew that procedurally a peace-keeping force could not be sent to northern Iraq without a new resolution of the security council and without the consent of the Iraqi government. He also knew that under the circumstances such a resolution would not be adopted by the security council. Therefore in a way the US circumvented the UN and then sought to legitimise its action.

## **Regional Analysis: Confusion Confounded**

#### P C Sarker

IN his article, 'Regional Imbalances in Indian Economy, Caught in Computerised Confusion' (EPW, November 11, 1995), S.M. Vidwans has tried to point out 'inconsistencies' in my paper on 'Regional Imbalances in Indian Economy over Plan Periods' (EPW, March 12, 1994). However, except for one or two points, his criticism is mostly unwarranted

At the outset, I admit that I should have taken equal number of variables across the five time-points. This limitation has been pointed out in the paper: "Thus nonavailability of data uniformly for all the five bench-mark years and the use of estimates for some data items have introduced certain limitations in the study" [Sarker 1994:627]. Besides, the conclusions drawn regarding the validation of inverted U-shaped hypothesis in interregional disparities could have been moderated, though the thrust of the argument would have remained the same. Therefore, too much criticism on this ground such as "the varying number of indicators has in fact played a havor with Sarker's analysis and conclusions" (p 2887) is unwarranted.

Vidwans has unnecessarily tried to mix up p-dimensional plotting of n units and variance of data set with one-dimensional scale plotting of 'dendrogram' in cluster analysis. His confusion is reflected in his comment, "simple geometrical and statistical relationships, however, spoil the excitement" (p 2888). In dendrogram analysis, euchdean distances (d) were used as inputs and the linking of d<sup>2</sup> with the variance does not arise at all. One can use different types of distance measures (Distance or Dissimilarity Matrices) or use correlation matrix (Similarity Matrix) for dendrogram plotting. Therefore, the concept of p-dimensional plotting of n units and relating with variances do not come into the discussion of dendrogram. Here the distances (even rescaled distances) are considered for plotting the graph. While plotting a dendrogram, at every stage of amalgamation the smallest distances are considered in the single-linkage method which has been used in my exercise. After choosing the cut-off point at certain distance by examining the dendrogram, one chooses the clusters of units based on one's judgment. For choosing the cut-off point, I have calculated 'average' distances and presented along with 'maximum' and 'minimum' distances which incidentally is not required for dendrogram analysis

Vidwans' other remark on dendrogram was that "a dendrogram is further ineffective in representing reality because a highly developed state and a backward state will appear as neighbours in it simply because both are removed from the rest...it is not clear how, by themselves, these pictures help in telling anything about disparities, development, or structural changes" (p 2892). His statement itself shows that he could neither understand the interpretation nor the purpose of using dendrogram. In dendrogram, the clusters are formed based on similarity or dissimilarity pattern among the units (states). It was not used to measure the disparity or judging structural change, but to identify the similarity (closeness) in the pattern of development. Again, interpretation of dendrogram might confuse a layman but not any genuine multivariate user The graph should be always interpreted with respect to real data. The graph helps to concretise the idea in a better way than the raw data do. Thus the amalgamation of a unit (state) on the right or left side of another unit is not a problem at all to a multivariate user. It is the convenience of drawing and depends on the starting procedure followed by any individual. Here only one thing matters, that is, the distance of merger of two units/clusters. Therefore, Kerala which is drawn near Punjab in the first graph does not mean that they have formed a cluster or they have less distance. It can only be said that Kerala has merged with the 'cluster of the rest of states' earlier than Punjab. The minimum distance with Punjab may be occurred with any state within the cluster. If Kerala is drawn even on the left side of the cluster, the interpretation of the result will not differ. Several types of graphs may be plotted using different methods and in different ways. Some exercises in this respect may be seen in Aldenderfer and Blashfield (1990).

Another major area of his graceless criticism is regarding the use of 'principal component analysis (PCA)' for developing a composite index and thereby measuring disparities based on these indices/scores. He has raised several questions in different dimensions. I am quoting some of his comments and presenting my arguments in that respect in the following paras.

Firstly, the use of principal component score as a development indicator is controversial since the beginning of its application in computing is composite index.

Many researchers have argued in favour while many others are against its application. In reality, it depends on individual's choice. Principal component analysis (PCA) and its related analytical techniques are being used in economics from the time of Kendall (1939). Subsequently, several analyses were carried out by Farrar (1962), Anderson (1963), Pal (1963), Adelman and Morris (1973), Cant (1975), Kundu (1980), Mitra et al (1981), Chakravarty Committee (1981), Hemlata Rao (1984) and many others. The advantages and disadvantages have also been discussed by many researchers. It has been used extensively to judge the level of development and thereafter the inter-regional disparities in development have been judged based on component scores [see Adelman and Morris 1973, Rao 1984, Dadibhavi 19911.

Secondly, Vidwans' argument that "the change in the variance of the first PC scores and changes in disparities are two unrelated aspects of situation" (p 2888) and his subsequent argument in the next para that "the PCA fails in its objective of assessing the changes in disparities over the study period" are controversial in nature. He has not given any references in support of his arguments but tried to prove some other established facts. In the PCA, I have derived the first component which accounts for the maximum variability (or variation) within the data set. If the first PC is highly correlated with all the variables, it captures the maximum variation and represents the data adequately [see, Chakravarty Committee 1981]. In reality, it may not happen. If any changes occur in any variable as discussed by Vidwans, it would not be exactly reflected in the transformed variable (i.e., PC Score). It depends on what is the percentage of variation explained by the component, what is the loading of the indicator and also the relative changes that have occurred in other indicators. It is a well known fact which he has tried to re-establish. Many researchers like Ashok Mitra, S Mukherji, R Bose and L Ray (1981) have used these scores for further analysis, where they have carried out 'factor analysis'-cum-'distance analysis'cum-'cluster analysis'-cum-'bunch analysis'. As against these traditional techniques, many have tried to develop alternative indices like Iyengar and Sudarshan (1982) and UNDP (in its various reports on human development).

Thirdly, though Vidwans has objected to the use of principal components, he has also suggested different alternatives for computing the scores in his Statistical Notes (p 2893). Actually, the computation of the PC score based on standardised variables timits the variances to lesser dimension. The scoring formula used in my paper was (G<sup>T</sup>G)-1 G<sup>T</sup>X, where G is the loading matrix and X is the standardised data matrix which is similar to the formula suggested for calculating scores by Vidwans (second alternative, i e,  $y(x) = \sum u_i x_i$ , where  $u_i = a/(\sum a_i)^{n_i}$ (p 2893). In Vidwans' formula, scores depend wholly on the loading vector of the corresponding component, whereas the formula defined in my paper takes into account the whole loading matrix. His comment in this respect was that "the use of wrong statistic gives an exaggerated impression of increase in variance of the first PC and, by Sarker's logic, in disparities over this period" (p 2894). I do not understand how his formula is superior to the one used by me. It is well known that after standardisation of the variables, the variancecovariance matrix turns into a correlation matrix and that matrix is the basis for computing the component loadings Therefore, the scores based on our formula will be higher in magnitude and also will generate variance of higher order, which he has described unfortunately as inflated one in his statistical note. Actually, the tiend visualised in the standard deviation (SD) for the PC scores calculated by me was also revealed in his calculation for yex) even after adjustment with number of variables, i.e, by multiplying them by square root of (13/14) in his article (see Table, p.2894). The actual magnitude of variance depends on the scaling of scores and the trend of that was important but not the actual magnitude. For convenience, it can be inflated for better interpretation. Similar opinion may be found in Kundu (1980), where he has suggested the variables may not be divided with their respective variances. Then the variance of the score actually gets multiplied by the variance of x (indicator) if it were calculated earlier based on standardised variables. According to him, if the aim is to examine the disparity, one should not divide variables by SD. An application on the lines suggested by Kundu may be found in Sarker (1995).

Fourthly, in a similar vein Vidwans has put forward his suggestion for computing combined component scores (CCS) while criticising my approach without understanding the reasons behind that. I quote his statement verbatim: "The CCS should be the total of the two y scores, which in effect means weighted addition of the two w-scores with weights inversely proportional to the square root of the respective latent roots. What Sarker has done is the opposite when he uses weights proportional to the variance of the respective score, that is propostional to two latent roots" (p 2894). It is a fact that I have chosen the proportion of variances explained by the corresponding components as weights. As the main purpose in my study

was to examine the variation across states. it was felt that the first component should get more weight as it explains the maximum amount of variation in the data set. Similar logic is also applied while computing principal components from the original indicators. An indicator which has higher variation also gets higher loading. Some researchers like Nanjappa (1968) and Iyengar and Sudarshan (1982) have developed an alternative to principal component analysis (or factor analysis), some methods where weights for calculating index are chosen as inversely proportional to variance. As we have used PCA method, the weighting pattern which I have used seems to be justified.

Fifthly, Vidwans has criticised the changes in loading pattern or loading values over five different time points. His confusion is clearly reflected in his statement "the results show some clear aberrations that needed explanations which Sarker does not ofter. One does not therefore know whether he noticed them in his rush to analyse and interpret" (p. 2892). Virtually he has questioned all the loading values of the indicators and their changes over time by putting a question mark: 'Why?'. Actually, getting higher leading values depends on the variability of the indicators and the relational dimensions that exist between the component and the indicators. When there is not much variation in the values of the variable, the variable will lose weight in the loading structure. Then it will naturally lose its importance as a development indicator for comparison of inter-regional disparity Again, if any variable moves to the opposite direction of the general trend of other variables, it will get negative signs. Therefore, 'number of people below poverty line' gets a negative sign which is valid. If this did not happen, it would have contradicted common sense. But Vidwans has put a question mark on all these points. It is true that I should have given more explanation in this respect. As I have not presented the data set at all, it was not considered necessary to explain the variables in detail

Sixthly, the conclusion drawn about the trend of disparity taking a few time-points was another point of objection of Vidwans. Actually, similar type of conclusions are drawn by others also as in the case of Kuznets (1957), Williamson (1965), Nair (1985), Tewari (1985), Hemlata Rao (1985), Roy Choudhury (1992, 1993), and many others also. The variation explained by PC Score depends on the communality  $\Sigma a^2$ , which itself varied over time. At each time-point, the loading structure was different even though variables were standardised. Therefore, the capacity of explaining the variability is taken care of by loading structure also. The trend in disparity was examined using coefficient of variation (CV) on the scores by many others such as Hemlata Rao (1984) and Dadibhavi (1991, 1992).

In the case of two-dimensional plotting of first two PC components, Vidwans' observation was that "since in actuality the two scores are uncorrelated in all benchmark years, one would expect roughly uniform distribution of 15 states in four quadrants" (p 2892). He has not given any theoretical justification except making a plain statement. I have plotted the graphs taking mean at the centre of plotting in the paper and also in other papers but have never observed this to happen. I have also examined the graphs plotted in books like Chatfield and Collins (1980) and Lebart, Morineau and Warwick (1984). The validity of his statement was not found in any literature. Besides, he has some doubts in respect of judging the influence of one factor (component) on another factor when they are perpendicular. He should be aware that this happened not only in PCA but also similar type of other graphical techniqueslike bi-plot, correspondence analysis, etc. In correspondence analysis, the main purpose is to examine the inter-relationship between two factors. In both bi-plot and correspondence analysis, the transformed data matrix is bifurcated into two orthogonal matrices using singular value decomposition (SVD) method and examine the relationship between two factors. Weller and Romney (1990) have shown the relationship between correspondence analysis and PCA and also other multivariate techniques

About the use of cumulative plan outlays (CPO), his observation for not giving proper explanation about percapita CPO is justified. I could have given the reasons for choosing per capita CPO at current price also. In my study, I have examined the impact of plan outlay on development measuring the relationship between per capita CPO and index of development (CCS). In his critique, he has remarked "it is mentioned that it is unrealistic to relate it to the values of indicators for 1960-61 because that assumes all indicator values to be zero at the beginning of 1951-52, i.e. before the first UYP" (p 2889). The checking of causal relationships, that is, whether development attracts fund allocation or allocation of fund leads to development, was not my aim. My purpose was to examine whether the higher developed states had received higher plan ontlays or not. This relationship was examined by simple correlation analysis Correlation measures the linear association between variables and is independent of both origin and scale. It is not always true that to examine the effect in regression, one has to subtract the variables from the starting point because the constant coefficient (a) in the equation takes care of the unexplainable portion. The contributory part is explained by the coefficient of explanatory variable (b). Besides, in social variables, subtraction is more dangerous as it is known that to increase life expectancy say from 75 to 78 requires more expenditure than the amount required to increase from 30 to 50. This is also true for literacy, urbanisation, irrigation, food-production, etc. My statement that planning might have played a role in the development process of a state is a fact. This was examined by many other personalities, viz, Das (1993) and Gupta (1973).

Considering that the plan outlays from 1960-61 onwards had no effect on any state and on the values of the 13 indicators already reached in 1960-61, he has calculated the values of  $r^2$  which were 0.47, 0.51, 0.52 and 0.53 for the last four bench-mark years. However, his comment that "no development took place at all" is wrong. The result only signifies that the trend of relationship remains, more or less, the same in nature, ie, the explanatory power of per capita CPO for development remains at same level. It is really strange that he has also calculated the correlation between the index of past period (say, 1960-61) with the per capita plan outlay for the next decade (say, between 1960-61 and 1970-71, ie, 1961-71) (p 2891). If he would have taken the plan outlay for the period between 1950-51 and 1960-61, he would have got a better relation for the year 1960-61 and, applying similar logic. much better relation in 1970-71 would have been arrived.

Some mistakes in the figures in my article have been pointed out by him in the writeup. Actually, one can easily verify them from the table as he has done. As the proofs were not sent to me for correction, they could not be corrected. The values of 'd' (1 e, euclidean distance) for the states were compiled taking standardised variables where decimal corrections had been carried out three times and ultimately presented the values in two decimal places in the tables The average values of d2 (squared euclidean distance) which Vidwans has pointed out are not substantially different from the average values calculated by me if one converts the 91 values of d' in the table into that of d?. Therefore, magnifying these averages as 'mistakes' is unwarranted. Besides, he has shown an allergy for computer as he has mentioned on several counts. Under the subheading 'A Greek Tragedy', he has said, "He became a prisoner of the analytical procedures and mechanisms rather than one concerned with their relevance to the substantive issues underlying his questions. The scale of his computational work led me to assume that he used a computer and ready softwares, and that assumption made me employ the adjective 'computerised' in the title of the critique" (p 2893). The fact is that I have used only one computer package

for calculating component loadings in principal component analysis. All other calculations were carried out manually taking some help of pocket calculators because multivariate graphical packages were not available in my organisation at that time.

In some cases, Vidwans has tried to disprove some of my conclusions only to support the same at large. It is a matter of regret that instead of clarifying some points, he has contributed to the popular phobia about computers and computer-based techniques. Vidwans' critique would have been useful had it been directed towards suggesting a constructive alternative. Instead, a large part of his article is devoted to some points which have no validity either in theory or in practice. I have done no more than to apply techniques used by others in different contexts. In conclusion, I may point out that no statistical technique can do justice to a data set.

## RESEARCH/STUDY GRANTS IN INTERNATIONAL RELATIONS

The ASRC is happy to announce a series of research/study grants in the field of international relations (broadly defined). Eligible M.Phil and Ph.D. scholars and college and university teachers are welcome to apply for these grants under the Ford Foundation programme in international relations. *Preference will be given to those working/teaching international relations of South Asia*. These grants are in three categories:-

- 1. Research Grant (RG) supports basic research in the field and the benefits include:
- (a) one round-trip sleeper-class railfare from the grantee's University to Hyderabad, subject to a minimum stay of 14 days for a 21-day grant and 21 days for a 28-day grant; (b) travel allowance of Rs. 60/- per day calculated to the nearest quarter day; and (c) a per diem of Rs. 60/- for each day's use of the ASRC Library. Grants are awarded for periods of 21 to 28 days.
- 2. Study Grant (SG) supports young scholars or teachers, who wish to come to the Centre to read intensively on some aspect of international relations either in preparation for research at the M.Phil and doctoral level or to strengthen their teaching international relations. Benefits are same as those provided for Research Grants.
- 3. Middle Award (MA) supports IR scholars who have had their Ph.D. for five or more years and have demonstrated evidence of continuing scholarly activity. Benefits are:
- (a) one round-trip second A.C./first-class railfare from the grantee's home to Hyderabad, subject to a minimum stay of 14 days for a 21-day grant and 21 days for a 28-day grant; (b) travel allowance of Rs. 100 per day calculated to the nearest quarter day; and (c) a per diem of Rs. 100 for each day's use of the ASRC Library. Grants are awarded for periods of 21 to 28 days.

Deadline for applications: 15 January for summer awards and 15 July for winter awards.

In addition, a limited number of Scholar-in-Residence (SIR) grants are given by invitation to senior and recognized scholars and teachers in the field.

#### Vol XXXI Nos 41 and 42

October 12-19,"

### Language and Its Identities

Kannada nationalism, like all nationalisms, attempts to produce a solidarity among all Kannada speakers in order to efface the specificities of caste and class, and pits itself against other dominated minorities rather than addressing the hierarchical division of labour that has ensured Kannada's dominant status. As long as it continues to privilege the identity of Kannada over other democratic aspirations, the Kannada movement will tend increasingly towards alignment with strident communal or anti-minority forces. Already a range of moderate and progressive intellectual positions within the movement have been overshadowed by more strident voices.

### Miracle or Meltdown?

In the past few months several of the more 'successful' south-east Asian economies have been plagued by problems of decelerating exports and deteriorating balance of payments positions, slow-down of output expansion and decline in employment in export industries, domestic imbalances requiring stabilisation policies, and the like. While the situation is not anywhere near the Mexican case, the strong dependence on foreign capital does bring out one similarity – that of external vulnerability – which also has important policy lessons for other Asian countries.

#### Lessons for the Left

In the context of the rise of the communal variant of fascism and its striving towards gaining a parliamentary majority, the historical experience of the Left in grappling with the issues of consensus and nationalism; fascism; and bolshevism, commune and socialism holds vital lessons for the Left in India. 2823

#### Wrong Model

For India it will be a sound strategy to draft a wide-bodied law to protect plant varieties without accepting the restrictions of the UPOV model. In this way when TRIPS comes up for review in 1999 and the pressure mounts to tighten our intellectual property rights regime further, we will have more space to negotiate. 2788

#### Not Islam's Fault

The law of marriage in its essence, like all civil laws, is about regulating economic transactions, specifically women's access to and control over property. The Islamic provisions of 'mehr' and marriage agreements had stood Muslim women in good stead in the last century. The subsequent decline is not a reflection on the Islamic law of marriage but a sad comment on the fate of women's rights in a communally vitiated and patriarchally tilted social order.

2832

#### Pakistan and Islam

In attempting to Islamise Pakistan, the country's leaders from Jinnah to Zia were not so much upholding Quranic principles as placating influential sections within the polity. 2800

#### **Credit Disarmed**

The RBI's conventional approach of tinkering with reserve requirements and signalling monetary policy changes through open market operations has robbed credit of its dynamic role in the development of the economy. 2781

#### **Exports in Ninth Plan**

A policy framework for exports in the Ninth Plan against the backdrop of the trends in exports in the last five years and the issues thrown up by them. 2817

#### A Rare Man

A generation ends with the passing of Satya Brata Sen, a generation which believed that the focus of the nation's affairs deserves to be exclusively on expanding the welfare of the hundreds of millions of Indians made up by the peasantry and the working classes and, further, that a scientific approach must inform analysis of the problems and issues that affect the common people.

2789

#### **Power Losses**

Changes in the pattern of demand for power and weak distribution systems are the major contributors to the rising transmission and distribution losses. 2793

#### **Rural Credit**

The finance minister's proposal to set up state agricultural finance corporations provides an opportunity to revive the Agricultural Finance Corporation, an all-India public sector institution which has the necessary consultancy expertise in rural financial services. 2791

## Gay and Lesbian Movement

THOUGH Sherry Joseph's analysis of the gay and lesbian movement in India (August 17) is mostly an accurate and faithful account of what has been transpiring in the movement to free sexual minorities in India, there are some unconscious discrepancies. Joseph has written (p 2229) thus: "None of the publications have a lesbian on their editorial board and the columns are male dominated. It is also known that the lesbians who were members of the editorial board of *Bombay Dost* in 1990, no longer serve in that capacity."

The facts of the matter are as follows. Bombay Dost started with an editorial collective of three gay men and three lesbians. There was no imperative or necessity at all for the gay men to work with the women except for a sincere desire towards both gender justice and equity. Bombay Dost was started not just as a platform for gay activism but primarily to confront issues related to unprotected homosexual transmission of HIV/AIDS and STDs. As pointed out by this author in the important session on 'Maleto-Male-Sexual Transmission' at the Second International Conference on AIDS in the Pacific held in Delhi in 1992, there is a wilful and purposeful refusal to accept the existence of homosexual behaviour in India. From the very beginning of the HIV/AIDS crisis, the contention of the Indian government has been that homosexuality is a result of "western bourgeoise decadence". The very refusal of the West Bengal government to agree to sero-surveillance for HIV in the general population can be traced to this refusal to accept some uncomfortable issues on sexuality in India. Not only did this attitude lead to the victimisation of female sex workers but it also eleverly diverted attention away from studying the sexual behavioural patterns of the male population.

As a homosexual who grew up in the sensual urban homocrotic ambiences of Mumbai city, I knew we were sitting on a time bomb. With a declining female-male ratio, more disposable income in the hands of the male working class for recreational sex and the slow but steady visibility of homosexuals because of the urban milieu, three of us male homosexuals decided to publish Bombay Dost around issues of HIV/ AIDS. When it was pointed out that safer sex messages did not sink in without stressing sexual orientation, sexual education and orientation became the foundation of the charter. With that it became very important to have both gender justice and a lesbian perspective in the subcontinental context.

When it became impossible for the newsletter Bombay Dost to be run on an issue-by-issue basis without funding or

grants, and with no support in marketing or editing from the lesbians (articles, writing, poetry either came in way past deadlines or never arrived at all), new strategies for survival had to be charted out. The lesbian members were not at ease with each other and thus could not work as a cohesive team; there was no follow-up to the deluge of letters from isolated lesbians in the mofussil towns and a personal discomfort working with somebody like me who was open and guiltless about my sexuality. I also discovered the hard wall of political correctness lying under the gentle feminity of the head of the lesbian group.

Meanwhile, no effort on our part has ever been or will be made to break the organic relationship. Bombay Dost still functions as an address for lesbian mail which is forwarded dutifully without even a single protest of what the women's group is doing with it. Till date we have no record of who sorts the letters and how the letters meant for women have been handled or whether they have been answered at all. As responsible members of this coalition, it was pointed out that at least the basic information be shared but the answer has been disappointing. Finally, the male members of the board decided to do some forward planning. I was also exhausted running around looking for funding to run the newsletter. In late 1994, three years after running it with meagre funding, two of us (Suhail Abbasi and me) founded Pride Publications, a company incorporated under the Indian Companies Act, to raise capital from within the emerging gay community.

What was uncomfortable was the fact that lesbians did not perceive the HIV crisis as a feminist problem. As a matter of fact neither do the feminist groups anywhere in India. And this despite the fact that the worst

infected groups at risk are female sex workers. the wretched of the earth in the hell-holes of Indian redlight districts. We also did not realise that whereas Indian lesbians saw private space as their theatre of operation. Indian gay men operated in the open public spaces as sexual environments where they met other men and had sex with them (as in public parks, public toilets and public transport termini). The problems were thus vastly different. Police brutality with us was on a completely different level than that experienced by women. The lesbians also refused to see us differently from other men in heterosexual patriarchal structures where we operated as subversives and comrades in arms when the need arose. We on our part found it increasingly difficult to re-educate ourselves about the misogynism within the emerging gay community in India because of the general drift between the gay men and lesbians. But there is no gainsaying that we have tried very hard to make progress in this direction. The fact that HIV prevalence in the gay community in Mumbai has crossed 50 per cent, makes it imperative that we need all the support we can get to help us come to terms with our condition; more than half the 'human' guinea pigs in the illegal BIV vaccine trials unearthed recently in Mumbai are gay men.

The editorial pages of *Bombay Dost*, however, have always remained open to the lesbians. Whenever articles are submitted, they are warmly accepted without hesitation. We have had fresh meetings with the lesbian group, Stri Sangam, on our own initiatives to evolve a new relationship. We sincerely wish that this will be a fruitful one.

## Chimera of Monetised Deficit

In its Annual Report for 1995-96 the Reserve Bank has suggested that the central budget should present an estimate of the monetised fiscal deficit consistent with the objectives of overall monetary control. The proposal should cause some raising of eyebrows for two reasons. First, it is difficult to estimate in advance how much of the fiscal deficit would have to be financed by RBI credit. Second, and more important, what turns out to be the final year-end monetised deficit may contain a major component determined not by the year's fiscal operations and needs but by the central bank's open market operations in keeping with the emerging monetary situation, over which the RBI should have exclusive control.

All measures of the budgetary deficit - whether the conventional deficit, the gross and net fiscal deficit, the primary deficit or the revenue deficit - yield numbers which are endogenous to the budget in that they are directly derivable from the budget's estimates of receipts and expenditures. The monetised deficit, however, is a different animal; it goes beyond the government's budgetary operations to cover the Reserve Bank's holdings of government paper acquired by the central bank from the market in pursuance of monetary policy objectives or successful debt management. The monetised deficit represents increase in net RBI credit to the central government which is the sum of increases in the RBI's holdings of government debt instruments plus any draw-down by the government of its cash balances with the RBI. The debt instruments comprise (i) ad hoc treasury bills, (ii) 91-day treasury bills sold on tap, (iii) 91-day treasury bills sold by auction, and (iv) dated securities. While ad hoc treasury bills are issued to the RBI alone and represent automatic monetisation of the budget deficit, the other types of TBs and dated securities may enter the RBI's holdings either by initial subscription or by net purchase from the market. While purchases from the market are essentially guided by monetary policy considerations, initial subscriptions by the RBI to take up any slack in the market response too may be part of debt management. The finance minister, while framing the budget for the coming fiscal year, need not be expected to have any clue to the possible size of these central banking operations. The central bank itself may not be able to anticipate the size of the monetised deficit that emerges eventually in pursuance of various fiscal and monetary policy objectives. Even when the RBI plans to inject a certain amount of primary money into the system as part of domestic credit expansion, it may choose to contract liquidity through open market operations in government paper and pump in liquidity instead through refinance to the commercial sector or through foreign exchange operations.

Against this background, to expect the budget to "indicate the total recourse to the Reserve Bank whether by way of dated

securities, treasury bills or other temporary accommodation", as the RBI wants it to, is unrealistic. Recent experience confirms this. Probably under the impulse of the so-called long-term fiscal policy, the 'Budget at a Glance' document began to present every year the estimate of 'net increase in RBI credit' just below that of the 'overall budget deficit'. While the overall budget deficit or the conventional budget deficit is the gap between all receipts and expenditures and is financed by the issue of 91-day treasury bills (including rediscounted and auctioned bills) irrespective of whether held by the RBI, banks or others, net RBI credit to the government covers the outcome of all the operations of the RBI in government paper, TBs and dated securities alike. Presenting the estimate in the budget documents, it was evidently realised. served no purpose and the practice was abandoned from the budget for 1994-95. The irrelevance of the exercise was evident from the fact that for every year the estimate of 'net increase in RBI credit' was shown as identical to that of 'overall budget deficit', implying that the projected monetised deficit was the same as the conventional deficit which, of course, is never the case in reality. The budget documents then carried the disclaimer that the figure of net increase in RBI credit was not independently estimated, but even if a bettergrounded estimate of the 'monetised deficit' could be projected, what purpose would it serve?

Recent experience, even during the period when the ministry of finance and the RBI have been implementing the stabilisation and structural adjustment programme in concert, is distinctly unpro-mising. For 1992-93, the budget deficit was Rs 12,312 crore (Rs 12,757 crore according to the RBI), but net RBI credit to the central government was just Rs 4,257 crore. In the next year the budget had anticipated a deficit of Rs 4,314 crore, but the year ended with a deficit of Rs 10,960 crore, net issue of ad hoc TBs of Rs 6,300 crore and, startlingly, one of the lowest levels of net RBI credit to the central government at Rs 260 crore. Explaining the outcome, the RBI had claimed in its Annual Report for 1993-94 that its open market operations had partly neutralised the expansionary impact of capital inflows and the large budget deficit. Sale of government securities to the tune of Rs 9,047 crore from the RBI's holdings had brought down the monetised deficit. Obviously neither the central budget nor the RBI's monetary policy statements could anticipate these developments. Again, for 1994-95 the budget deficit was initially placed at Rs 6.000 crore but the final outcome was a deficit of only Rs 946 crore, net issue of ad hoes of Rs 1,750 crore and net RBI credit to the government of Rs 2,130 crore. The RBI had then gone to town with the claim that for the first time in almost two decades monetary expansion through the year could not be attributed to monetisation of the budget deticit and that this had been made possible by "the fundamental reform announced in the union budget 1994-95 and the agreement subsequently reached between the government and the Reserve Bank to delink automatic monetisation from the budget deficit". This 'fundamental reform', made possible only by unprecedented portfolio inflows of over Rs 30,000 crore in the second half of 1993-94 and the first half of 1994-95, could not be sustained beyond one year. The government read in the large capital inflows false signals to borrow massively in the market and the RBI complacently assumed that its agreement with the government on limiting and eventually phasing out the use of ad hoc TBs was already a success. However, once the portfolio inflows slowed down and the financial assets showed no significant rise, these facile expectations were belied and the much-vaunted agreement between the finance ministry and the RBI was frequently breached.

The official expectations were, of course, quite unrealistic on many counts - the low revenue elasticity and unsatisfactory fiscal situation, the unpredictability of portfolio inflows and the inadequacy of financial savings, all of which the finance ministry and the RBI refused to recognise. Hence their attempt to foist the unsustainable 'reform' of delinking the budget deficit from monetisation Already in 1995-96, the overall deficit, initially budgeted at Rs 5,000 crore, touched Rs 9,934 crore, but with net issue of ad hoc TBs of only Rs 5.965 crore. Even so net RBI credit to the centre rose to Rs 19,855 crore because the market simply could not absorb the high budgeted levels of gross borrowings of Rs 40,806 crore and net borrowings of Rs 27,087 crore. In government paper auctions, the devolvement on the RBI aggregated Rs 12,655 crore (32.8 per cent of gross market loans) in 1995-96 compared with only Rs 157 crore (0.7 per cent) in 1994-95. Also, by the end of March 1996 RBI holdings of auctioned 91-day TBs had jumped to Rs 3,211 crore compared with only Rs 68 crore at the end of the previous March. Leave alone the government, the RBI could not have imagined that its working estimate of the expansion of aggregate deposits of scheduled commercial banks of Rs 65,000 crore (or 17 per cent) would prove so wide of the mark, with the actual achievement turning out to be only Rs 49,370 crore (12.8 per cent). This compared with deposit growth of Rs 53,630 crore (16.1 per cent) in 1994-95 and Rs 52,144 crore (18.6 per cent) in 1993-94

In the current year as well the monetaryfiscal situation has developed along unexpected lines. While overall financial assets are not growing, the RBI has pumped in as much as Rs 12,725 crore by slashing the effective CRR from 15.7 per cent in March 1995 to 11.5 per cent by July this year. The CRR is to be brought down further to approximately 9.2 per cent by January 1997, releasing yet another Ks 8,550 crore. As a result, banks' investments in government securities have risen by as much as Rs 13,074 crore so far this year up to September 27, against Rs 6,178 crore in the comparable period last year. The government has already completed two-thirds of its net borrowing programme of Rs 25,498 crore for 1996-97. Hence the use of ad hocs has dwindled to such a low figure as Rs 3.360 crore as of October 4 compared with Rs 10,610 crore last year and net RBI credit to the centre has come down to Rs 3.801 crore as of September 27 compared with Rs 8,714 crore in the comparable period last year. Clearly, such moderate levels of monetised deficit and use of ad hoc TBs could not have been foreseen at the time of framing the budget for 1996-97.

Such being the record of mismatch between initial budgetary expectations and the final outcomes, on what basis does the RBI expect the government to anticipate the sources of financing of the gross fiscal deficit among non-bank institutions, banks and the Reserve Bank? The relative importance of these sources in financing the fiscal deficit will fluctuate depending upon the evolving financial situation in particular years. In the interest of monetary and financial stability the RBI necessarily has to combine different central banking instruments such as open market operations, refinance and rediscount facilities and even direct lending to promotional agencies. The RBI's suggestion that the central budget present a target figure of monetisation of the fiscal deficit for the year, on the other hand, stems from a narrow monetarist perspective on money supply targets and money multiplier processes.

HEALTH

#### In a Shambles

THE recent outbreak of dengue fever is yet another and highly ominous sign of the breakdown, not only of the disease control programme, but in general the welfare of the state. For the ennui that appears to have gripped the health administration has its roots in the administration's helplessness in the face of circumstances which are creating disease conditions.It also shows the limitations of vertical programmes in the presence of an inefficient, badly funded and rigid health infrastructure. And what is of even greater concern is that the courts had to be moved to direct the Delhi and the central governments to take preventive and other measures against the disease.

Historically, health planners and administrators have had a blind spot for epidemiological inputs. Partly, this has been a reflection of the supposedly modern methods of controlling 'tropical'/communicable diseases which prescribed technical/medical solutions, quite ignoring the socio-economic components. This led in the 1950s and 1960s to an overwhelming emphasis being given to

centrolling disease vectors by destroying them without giving serious attention to the set of circumstances which make them breed. As a consequence of the vertical approaches to single diseases, ecological factors in vector control were often neglected: a glaring example of the current interpretation of this approach is the malaria control establishment pleading its inability to do anything about dengue carriers because its workers did not know how to distinguish the different types of mosquitoes. For instance, there was at one time a plan to eradicate the Aedes mosquito. the carrier of the dengue virus. However, objections came from a group of eminent epidemiologists and entomologists that destruction of the Aedes type would inevitably provide greater encouragement to the yellow fever carriers, and such a changed ecological picture would make for the entry of the far-more-difficult-to-control yellow fever into the country. It was felt at that time that with a good health care infrastructure, early detection and efficient case handling, dengue would be the lesser evil.

Today the dengue 'epidemic', not yet officially designated so, has brought the whole issue into the open in a different light. And the real danger is that the health establishment's blinkered response may be to launch an extensive eradication programme without comprehensive deliberations and without, of course, any move to introduce a health component in planning and implementing development programmes, urban and rural. In fact, just as industrial and large development projects now have to obtain environmental clearance. there ought to be a provision for considering the health consequence of any such project or plan before it goes off the drawing board... Some 50 years ago the Bhore Committee had appealed, in vain, for just such an arrangement.

**UTTAR PRADESH** 

### **Calculations Gone Awry**

THE most significant aspect of the Uttar Pradesh assembly elections has been the inability of the BJP to approach anywhere near the 213 scats mark required for a simple majority. The SP-BSP stand-off was expected to benefit the BJP in the three-cornered contest. Yet, the disjointed efforts of the Congress-BSP alliance on the one hand and the UF-Bharatiya Kisan Kamgar Party (BKKP) alliance on the other succeeded in restricting the BJP-Samata alliance to 176 seats, exactly the tally the BJP had reached when the SP and BSP had joined hands together in 1993. This time, for a change, all the main contenders in the election - the BJP. the SP and the BSP - made a conscious effort to do away with their caste identification and to project themselves as representing larger sections of society. The BJP, normally looked upon as an upper caste party, distributed 190 tickets to the OBCs as part of its programme of social engineering. The BSP which has a stronghold among the dalits of UP, gave only 86 tickets of its 299 tickets to scheduled caste candidates There were 102 OBC, 53 Muslim, 12 brahmin and 25 thakur candidates fighting on BSP tickets. The SP, the champion of OBC interests, put up 47 Muslims, 36 thakurs, 18 brahmins and 6 banias as candidates. Yet despite this conscious reorientation in seat distribution by the main contenders, none of them managed to drastically improve their performance. In the recent Lok Sabha elections the BJP had secured a majority in 236 of the assembly segments. But in the assembly polls it could garner only 174 seats. The BSP maintained its 67 seats while the SP by winning 110 seats improved upon its earlier position by one seat The Congress which stuck to its upper caste base, marginally improved its tally The party had given a majority of its 126 tickets to brahmins and a apputs and won 33 seats compared to 29 culier

By granting statehood to Utt wakhand announcing sops to farmers of western UP and forging an alliance with Ant Singh and Mahender Singh Likait prime minister Deve Gowda had made a scrious attempt to crode the BJP base in its strongholds. The formation of Uttarakhand has in fact turned out to be a boon to the BJP. The BJP bagged 18 out of the 19 seats from this region. The Congress (Tiwari) was trounced because of the impression that it had effected a rapprochement with Mulay in Sin h Yadav the principal foc of Uttar ikh indi i in western UP too the BKKP could win only 8 seats thereby largely failing to make a dent into the lat votes of the BIP. The Jinata Dal won 7 scats confirming its marginalised existence in the state

The first reports of the voting behaviour suggest that the Muslims to a large extent remained apathetic to the elections. They form 18 per cent of the state's population and can be decisive in determining the outcome in some 130 constituencies. The BSP made an attempt to win the Muslim votes by soliciting the support of the Shahi Imam of Jama Masjid of Delhi Though the All India Milli Council and the Mislim Personal Law Board opposed the move the common Muslim voter seemed apathetic and resigned This perhaps helped the BIP to capture seven out of 12 seats and six out of nine seats in Muslim dominated Moradabad and Bureilly districts, respectively

Given the poor performance of the allies of the SP and the low Mus im turnout the BJP should have performed bester. Instead, the large number of OBC condidates put up by the BJP seems to have alienated the upper caste support base of the party and idversely affected its fortunes. The delicate balancing of caste interests is the intractable problem facing the BJP in the state. Its opponents, on the other hand, having checked the BJP, will have the equally difficult task of making the SP and BSP sit together if the BJP is to be prevented from forming the government.

#### **POWER POLICY**

### Beating about the Bush

THE conterence of state chief ministers and power ministers in Delhi this Wednesday was an indication of how grim the power situation in the country, even as perceived by the government, is turning out to be The prime minister himself inaugurated the conference But while the meeting had the benefit of a 'national action plan' prepared by the central power ministry, judging by reports in the press, the prime minister's and the state leaders choice of issues to highlight does not hold out much hope for progress towards a transparent long-term national policy and the necessary institutions to implement it, the absence of both of which has been so largely responsible for landing the power sector in the present cul-de-sac despite all the hoopla about throwing the sector open to foreign capital and the domestic private sector

It is the lack of a clear policy and of independent agencies whose objectivity was above board which has been responsible for every one of the initial lot of private power projects the so called 'fast track projects, getting mired in allegations of corruption and padded costs and inflated tariffs. The prime minister, who himself has been the butt of charges over his handling of the Cogentrix project in Kainataka when he was the state crict minister evidently had this situation in mind when he lamented at the conference that if either the states or the centre take some decisions there are forces which try to attribute motives alleging that there is a nexus between the investors and the government" But his solution not untypically perhaps was to try and arrange a political truce a time has come when we should all collectively work forgetting our political party affiliations" The proposal may have its attractions, since political power in the states is now shared widely enough among different parties which may find it mutually beneficial to arrive at an understanding not to raise inconvenient questions

But, of course that does not take care of the problems either of corruption or of ensuring that power plants with the most efficient parameters are built. It is not the case by and large that investment in power projects has been held up because the state governments have not had sufficient authority or that decision making has been concentrated at the centre. Yet the main burden of the prime minister's speech at the chief ministers' conference was that the state governments would now be given unfettered freedom to decide on power projects. This is proposed to be ensured by further raising the size of projects which are required to be referred to the Central Electricity Authority (CEA) for techno-economic evaluation or indeed even doing away with this requirement altogether. In the same vein Deve Gowda also proposed that environment clearance of projects should be left to the state governments. Are the state governments not responsible to the people of their states, was his question

Techno-economic evaluation of large power projects and assessment and amelioration of their indisputably enormous environmental consequences are vital matters which require to be handled with competence, objectivity and transparency. The real issue is not whether these tasks should be undertaken at the state or the central level but that they call for independent agencies with the necessary technical competence. Not that the CEA today anywhere near fills the bill It had already been marginalised by the Narasimha Rao government and the then power minister NKP Salve But there is no getting away from the need for such agencies for the proper planning and operation of power projects, whether in the public or the private sector. And, contrary to the prime minister's implied suggestion, the popular democratic credentials of governments at the centre and in the states will in no way be compromised by setting up such bodies and placing them and their functioning within their legitimate sphere beyond the pale of (central or state) political and bureaucratic control Without such institutions however much the major political parties, following the prime minister's advice, may agree upon arrangements to share the loot, so to say, questions and suspicions will keep cropping up about the legitimacy of the projects which will certainly not be in the interest of their speedy implementation and smooth working One would have expected the Planning Commission to have given a lead on such matters but going by newspaper reports, the subject of a clear policy covering the many dimensions of the long term development of the power sector and the concomitant institutional framework does not seem to have figured very prominently in the address of the commission's deputy chairman to the chief ministers conference

Interestingly, on the very day that the chief ministers were meeting in Delhi finance minister Chidambaram, speaking in Vadodara was quite categoric that since the centre was not prepared to extend its counterguarantee to any more power project sheyond the five to which a commitment had been made private investors, whether foreign or Indian were unlikely to be enthusiastic about investing in the power sector unless the state electricity boards were restructured and made viable. The action plan' prepared by the power ministry does apparently siress the need for revising and restructuring electricity rates especially those for the agricultural sector, but the prime minister himself studiously avoided the subject at the meeting of state chief ministers and power ministers He had to for was not he just weeks back promising farmers in UP cheap electricity in the course of his campaigning for the state assembly elections there?

The current fiscal year has seen a rise of \$ 1.4 bn in official foreign currency assets (including SDRs) against a fall of \$ 1.8 bn in the comparable period last year. While both imports and exports have slowed down, a sharper contraction in import growth has resulted in a narrowing trade deficit from \$ 2.1 bn to \$ 1.4 bn. The deceleration in industrial growth has been very pronounced, with infrastructure industries suffering a setback since the latter half of 1995-96. While basic industries and consumer durables have experienced a sharp dip in growth in the first quarter of this year, growth of capital goods and intermediate goods industries too has slackened. Consumer non-durables, however, continue to do well.

# South-East Asian Economies: Miracle or Meltdown?

Jayati Ghosh Abhijit Sen C P Chandrasekhar

In the past few months several of the more 'successful' of the south-east Asian economies have been plagued by problems of decelerating exports and deteriorating balance of payments positions, slowdowns in output expansion and declines in employment in exporting industries, domestic imbalances requiring stabilisation policies, and the like. The south-east Asian situation is not anywhere near the Mexican case, but the strong dependence on foreign capital does bring out one important similarity – that of external vulnerability – which also has important policy lessons for other Asian countries.

THE recent growth experience of the southeast Asian economies has been the focus of much worldwide attention. This is partly because of the widespread conviction that Asia has become the new 'growth pole' of the world economy, able to sustain high growth rates even when there is no impetus to growth in other regions; and partly because of the assessment that this experience constitutes concrete illustration of the virtuous interaction between trade and foreign investment to create economic growth The successful proliferation of capitalism in east and south-east Asia is cited as evidence in support of economic liberalisation policies which encourage greater inflows of exportoriented FDI as well as countering the arguments that greater international integration can work against the interests of developing economics.

Thus, past and current patterns of growth in these economies are of immense interest to countries like India, as are the recent economic warning signals emanating from these countries. In the past few months, several of the more 'successful' of the southeast Asian economies have been plagued by problems of decelerating exports and deteriorating balance of payments positions, slowdowns in output expansion and declines in employment in exporting industries, domestic imbalances requiring stabilisation policies, and the like. In some of the 'secondtier' east Asian countries such as Thailand, Malaysia and even to some extent Indonesia, these problems have been compounded by speculative behaviour affecting exchange rates, in the context of large external debt. Such problems, appearing so soon after these countries have just been getting kudos from both multilateral organisations and international financial analysts for their strong economic performance, inevitably bring to mind the Mexican experience of 1995-96, in which celebratory appraisals were rapidly followed by dramatic collapse. The southeast Asian situation is not anywhere near the Mexican case but the strong dependence on foreign capital does bring out one important similarity – that of external vulnerability – which also has important policy lessons for other Asian countries

#### GROWTH IN ASIAN DEVLLOPING COUNTRIES

To understand the nature of the current economic difficulties, it is necessary to consider first the pattern of previous growth in east and south-east Asia. Over the past decade in particular, the Asian region has been the most dynamic in the world in terms of economic growth as well as increased trade involvement. Both in terms of the growth rate of GDP and the rate of export growth, the developing economies of Asia in the aggregate outperform any other grouping. In addition, the dominant share of capital flows to the developing world is now absorbed by Asia, and by a small set of countries (such as China) within Asia. Furthermore, within Asia, this growth has been much more evident in east and southeast Asia, especially China, the four Asian NICs and the second-tier high-growth economies of ASEAN. Indeed, south Asia has grown much less rapidly. West Asia has experienced stagnation and central Asia declines in per capita incomes.

The economic growth of east and southeast Asia is usually seen as trade-led, and certainly it has been fuelled by, or expressed in, high rates of growth of imports and exports, as shown in Table 1. It is evident from this table that while world trade – in terms of exports - has grown more than twice as rapidly as world income, developing countries as a group have shown faster rates for both of these than industrial countries, and Asian developing countries have been the fastest of all. The rapid rate of export expansion is usually seen as the engine of growth in these countries. Yet it is also evident that import volumes have also grown significantly faster in developing Asia than in the rest of the world, and have also grown more rapidly than export volumes. Consequently, many of the high-growth Asian economies have actually had continuing current account deficits despite the emphasis on exports. This suggests that there have been other factors, such as the ability to attract capital inflows, which have been significant in explaining balance of payments 'stability' in these cases.

It is worth noting another feature which emerges from Table 1: the difference in purchasing power of exports between developing Asia and industrial countries is much less than the difference in export volume growth. In fact, for all developing countries the purchasing power of exports has actually increased more slowly than that for industrial countries, despite more rapid growth in export volumes in the former. This suggests a fairly sharp movement in the terms of trade against all developing countries, and a slightly less sharp but still adverse movement in terms of trade for Asian developing countries.

There are currently two standard ways of interpreting these data. The first suggests that exports have been the engine of growth in these countries, fuelling rapid increases in GDP and thereby also in import volumes. Within this broad interpretation, there are varying positions on whether the export growth itself has been related to 'marketfriendly' economic policies which encouraged production for export, or whether such growth was the outcome of systematic neo-mercantilist strategies in such economies. The second approach treats export growth as a result rather than a cause of the growth process, and relates all of these features to the observed high rate of capital inflow into Asia. The most well known exposition of this notion is the 'flying geese' model originally developed by the Japanese economist K Akamatsu in 1932, and subsequently applied to the recent experience. It is worth considering the elements of this paradigm in some more detail.

#### 'FLYING GEESE' PARADIGM

This is essentially a variant of the 'productcycle' hypothesis of Raymond Vernon, in which trade becomes the vehicle for transferring new goods and technology across countries. As countries industrialise and their factor proportions change, some production (of certain more labour-intensive goods or particular labour-intensive processes) from the "leader" countries is shifted to the 'follower' countries Imports from the more advanced countries allow for the introduction of new goods, transfer of technology and capital goods into 'follower' countries, and eventually for their export to other countries Ultimately, the leader country loses competitiveness in a particular product, whose domestic production is then phased out and replaced by imports from the 'followers' who have by then built up competitiveness in that product FDI here becomes an additional channel for this process, as domestic investment withdraws from those sectors suffering from loss of competitiveness (typically labour-intensive sectors, such as textiles and leather goods) and instead becomes FDI relocating to places where labour is cheaper, in order to supply both domestic and foreign markets. Despite this, aggregate investment in the leader' country does not diminish because industry is constantly restructured and upgraded to move towards higher-skill, higher-technology products

The result is a constantly evolving division of labour within a group of regional eco nomies Increasingly, this formulation is used to describe a process which (contrary to Akamatsu's original exposition) is consistently benign and harmonious for all the countries involved. Since aggregate investment continuously increases and simul taneously promotes trade flows there is no trade-off between domestic investment and FDI in either the investing leader country or in the 'follower host countries FDI is seen to be essentially trade oriented and is always complementary to the productive structure of the host economy, even as it increases the exports of the follower Tech nological advances and transfers, shifts in competitiveness and changing trade patterns operate to the mutual advantage of all the concerned countries and do not involve either frictions or dislocations

This process is said to be in operation in Asia over the past decade in particular, with relocative FDI from the leader country Japan, moving first into the first-tier NICs and transforming productive structures there and then entering the second-tier NICs (the ASEAN-4 of Indonesia Malaysia, Thailand and the Philippines) and now even spreading into countries such as Myanmar and Bangladesh in ever spreading dynamic Lon centric circles of export oriented expansion

Obviously, the reality of the obscived process is both more complex and more problematic than this rosy picture. It is clear that the initial penetration of imports into a 'follower' country will adversely affect domestic producers even it consumers are better off Similarly, when follower countries can compete successfully in a range of products, the leader country's interests may be affected The many costs, difficulties and occasional impossibility of restructuring in both leader and follower countries are ignored in this paradigm. Further, the complex integration strategies of global MNCs mean that activities in any particular host country may not be such as to definitively benefit the host In fact, the requirements of flexibility and the need to safeguard technological advantages have meant that MNCs have typically ignored the specific requirements of their hosts in terms of building national competitiveness, and where this has occurred it has usually been an accidental by-product of overall MNC designs rather than part of the strategy

Most significantly of all, relocative FDI of this variety has rarely been of sufficient magnitude to ensure dynamic shifts in comparative advantage by itself. Most of the more successful Asian economies - that is those who have completed or are successfully completing the transition to industrialisation and higher value added produc tive structures - had crucial domestic policies in place, as well as particular initial conditions (including an early levelling of asset or income distribution through institutional reforms) which allowed them to benefit from increased trade. The most successful countries in Asia Japan and South Korea, did not industrialise using FDI at all, and South Korea relied largely on foreign aid and then external borrowing to finance its balance of payments deficits during the 1950s and 1960s The largest FDI hosts among the Asian countries until recently have been Singapore and Hong Kong, and in both of these countries, it is accepted that FDI has contributed little to upgrading and industrial deepening, and has been much more footloose than in the other Asian NICs

In fact the actual pattern of FDI nflow into cast and south Asia suggests that although recent FDI into some parts of south-east Asia may be broadly consistent with the 'flying geese' paradigm, in general the model is of very limited significance in explaining the relationship between FDI and growth in Asia Closer examination suggests that there is no 'homogeneous' east or south-east Asian experience with regard to either the pace of industrialisation or the role that FDI can play Rather, there are four broad and quite different categories of industrialisation and FDI experience, even in the south and southeast Asian region, as described below Elsewhere, FDI has played a very limited and typically ambiguous role, and certainly in most of south Asia, central and west Asia, there is no evidence of a virtuous cycle of growth spurred by foreign investment

#### REGIONAL DIVISION OF LABOUR

Asian economies can be divided into four sub regional groups (1) the first-tier NICs (newly industrialised countries) consisting of Republic of Korea, Taiwan Province of China Singapore and Hong Kong. (2) Southeast Asia, comprising Indonesia, Malaysia, the Philippines, Thailand, Cambodia, Laos and Vietnam, (3) China, and (4) south Asia, including Bangladesh, India, Pakistan, Sri Lanka, Nepal Bhutan, Myanmar, and Maldives These sub-regional groupings have varied in terms of recent growth rates of GDP, as evident from Table 2

It is clear that the average high rates of growth mask substantial differences between groups of countries. The differences would be even more noticeable if all the countries were considered individually, since some of the countries which are already among the least developed, such as Nepal, Bhutan and Myanmar, have also experienced very low rates of growth In general, the countries and sub-groups with lower rates of growth in the

1990s are typically also those which in 1990 started from a much lower base of per capita GDP. The virtuous nexus between FDI, exports and economic growth is supposed to describe the first three sub-regions, with the exception of the least developed countries. Yet even here, the experience is not uniform, and can once again be classified into four groups.

First, there is the experience of city-states such as Singapore and Hong Kong, which have been completely open 'free ports' from the start. Singapore in 1995 had the third largest stock of inward FDI in the developing world (after China and Mexico) at more than \$ 55 billion. Hong Kong too figured among the top 10 recipients of FDI, but the special characteristics of these two city-states make them unconvincing examples of the 'flying geese' style FDI-based expansion. This is particularly so because (as mentioned above) inward FDI in these countries has not been associated with technological upgradation in frontline areas, and has been part of footloose capital seeking further avenues in the immediate neighbourhood of these citystates. Thus Hong Kong is not only one of the largest recipients of FDI but also the single largest outward investor among developing countries, suggesting that much of its role may be in recycling and reexporting capital just as it does in goods trade. A similar story could be told of

In the other first-tier NICs of South Korea and Taiwan, FDI was never central to the industrialisation process. Rather, the government played the critical role, and statedirected production oriented towards the world market was the factor that determined the export thrust in these countries. Both these countries in 1995 had total inward FDI stock of only around \$ 15 billion each, just above one-third the level in Malaysia and one-fourth that of Indonesia. Since the mid-1980s, inward FDI has amounted to less than I per cent of gross domestic capital formation in South Korea and less than 4 per cent in Taiwan. However, in recent years these two countries have become capital exporters of significance, contributing strongly to the onethird of FDI flows into Asia which come from within the sub-region

The case of China, which has the largest stock of inward FDI in the developing world, at around \$130 billion in 1995, is exceptional on many counts. Having been through many phases of reconstruction, China has managed to generate relatively high domestic savings and investment rates. It embarked on the 'reform and liberalisation' path some years ago, but on the basis of an egalitarian agrarian structure and the almost complete absence of a domestic capitalist class, with the industrialisation process still firmly under overall state control. It is noteworthy that China has recorded extremely high foreign

investment inflows, along with rapid rates of industrialisation, GDP growth and export. expansion, within the framework of a 'restrictive' and controlled economic regime, excepting in the special export enclaves. Much of the GDP and export growth has been concentrated in the south-eastern part of the country, especially the coastal regions. The role of overseas Chinese in inward FDI has been crucial especially in the early years of FDI inflow into China beginning from the late 1980s. Nonetheless, despite this record of very high FDI inflow which is quite spectacular by contemporary standards, there is evidence that inward foreign investment is decelerating (World Investment Report 1996) and may have reached a temporary peak. This is partly because the Chinese government has become more selective in screening FDI projects to ensure compliance with national development priorities, and has also introduced measures to prevent speculative investment, for example in real estate. But it is also related to the fact that outward FDI from the top sources for China - Hong Kong, Macau and Taiwan - is losing momentum as the transfer of labour-intensive production slows down. Because of increases in land and labour costs in the coastal regions, labour-intensive export-oriented production has already become less attractive in China than in several other Asian economies. However, as long as the large domestic market continues to grow, China will still continue to receive a sizeable amount of FDI, although not necessarily of the 'flying geese' variety.

Finally, there is the more recent experience

- really confined to the past decade - of the

second tier NICs of south-east Asia. including essentially Indonesia, Malaysia and Thailand (ranked third, fourth and fifth, respectively, in terms of inward FDI stock in Asia in 1995) and to a much lesser extent, the Philippines. These could be said to constitute the second phase of industrial proliferation in south-east Asia, which corresponds most closely to the positive view that links 'openness' with economic growth based on FDI-led export expansion. If any countries could be said to approximate the mechanism suggested in the 'flying geese' paradigm, it is these, which have experienced very large increases in relocative FDI in the past five years, and have also delivered very high rates of export growth. Yet it is precisely these economies which are currently encountering the most severe difficulties, which calls into question the validity of the entire hypothesis.

EXPORT DECELERATION AND BALANCE OF PAYMENTS DIFFICULTIES

An important backdrop to the current predicament of the south-east Asian countries is the deceleration in exports which had become the engine of growth for these economies over the previous decade. Most Asian countries have experienced deceleration or decline in their manufactured export since the middle of 1995, and the causes for this sudden drop have still not been adequately explored. Two factors are most commonly cited: the saturation of developed country markets for electronic goods, which have been among the most dynamic export sectors; and the increased protectionism-

### **NAVDANYA**

# A CALL TO JOIN THE MOVEMENT FOR THE CONSERVATION OF AGRICULTURAL BIODIVERSITY

Navdanya is a national agriculture biodiversity conservation programme that promotes *in-situ* conservation and the building of community seed banks. Navdanya works with farmers, farmers' organisations, NGOs and government to facilitate seed conservation activities.

We invite people with appropriate technical background committed to the cause of conserving genetic resources in agriculture to join this emerging movement.

If you are interested write to us at Research Foundation for Science, Technology and Natural Resource Policy, A60, Hauz Khas, New Delhi - 110 016, Tel: 6515003 and 6968077, Fax: 6856795.

(despite GATT and the WTO) by industrial countries in the area of textiles and clothing imports, which remain the mainstay of NIC exports.

Yet these two factors are surely not sufficient to explain the precipitous decline in export expansion which many countries have felt in the past year. Thus, China's exports for 1996 are slated to decline in absolute dollar terms, after growing at an annual average of nearly 20 per cent over the 1990s. South Korea's exports, which grew at 13 per cent per annum in the period 1980-94, have fallen by 6 per cent in the past year, and the decline has been particularly marked in July and August 1996 (Asian Wall Street Journal, September 3, 1996). In Thailand, the deceleration in exports meant a growth rate of only 6 per cent in the first half of 1996, compared to 27 per cent in the same period last year. This reflects absolute declines in at least 18 important exporting sectors, and has been estimated to involve a likely decline in foreign exchange earnings in the current year and lead to job losses of more than 4,40,000 workers (Thai Banker Association, Business Day, September 3, 1996). Similar stories abound across Asian NICs and even south Asian countries like India and Bangladesh are experiencing export deceleration.

The point is that such patterns in exports have not been accompanied by reductions in imports, which have continued to increase strongly, thus leading to widening trade and current account deficits throughout most of south-east Asia. In the second-tier NICs, which have been more dependent upon foreign capital as well as less developed internally, this has in turn led to collapses of investor confidence, with worrying implications.

The most dramatic example is that of Thailand, whose international credit rating was recently downgraded by the rating agency -Moody's. Until very recently, Thailand was being held up as a model of prudent macroeconomic management and liberal economic policies that all other developing countries could usefully emulate. Thus the World Bank in 1994 reported that "Thailand provides an excellent example of the dividends to be obtained through outward orientation, receptivity to foreign investment, and a market-friendly philosophy backed up conservative macro-economic management and cautious external borrowing policies". However, the recent speculative run on the Thai currency, the baht, exposed a number of features of several such economies, which had hitherto been underplayed.

Principal among these is a high current account deficit projected at 7.8 per-cent this financial year. High current account deficits have been an accepted feature of Thailand's balance of payments during her 'miracle growth' years. Between 1988 and 1990 such'

deficits rose from 3 to 9 per cent of GDP. Since then deficits in the range of 6-8 per cent of GDP have been the norm. How do we explain these deficits, which are not only high when compared with deficits in most developing countries, but way above the level of 3.2 per cent, for example, at which India faced a balance of payments crisis in 1991?

Thailand's current account deficits were recorded in a context of robust export growth, averaging close to 15 per cent per annum during the 1990s. International comment on Thai economic performance focused on this aspect and her high current account deficits did not draw attention. Part of the reason for this silence was the perception that an external current account deficit is acceptable so long as it does not reflect a deficit on the government's budget, but 'merely' an excess of private investment over private domestic savings, financed with an inflow of foreign capital. Countries with significant budget deficits, such as India in 1991, are presented as unduly profligate even when the current account deficit on their balance of payments is much lower. Alarmist statements from international agencies often trigger the 'capital flight' needed to generate a balance of payments crisis. This provides the setting for adjustment programmes involving a 'retreat of the state' and a more open trade regime.

On the other hand, in countries with balanced budgets or budgetary surpluses, a high current account deficit is merely seen as reflecting the appropriate environment for foreign private investment rather than public or private profligacy. The acceptability of Thailand's unusually high current account deficits was thus due to the fact that, despite rising budgetary expenditures, it was a country which had run a budget surplus in recent years. Financial year 1996 is also expected to end with a 'healthy' budget surplus of 3 per cent of GDP.

It now appears that private financing alone is inadequate to sustain a high current account deficit. The nature of that financing matters. Initially, Thai deficits were financed with FDI inflows which also supported the country's export effort and raised the rate of growth. FDI inflows into Thailand rose from a little more than \$ 250 million in 1986 to almost \$ 2,500 million per annum by 1990. Further, host country data suggests that, even by the mid-1980s foreign affiliates in the manufacturing sector diverted a substantial part of their sales, estimated at 33 per cent, to the export market.

However, the situation appears to have changed recently. After 1990, annual FDI inflows have been on the decline from a peak of \$2,444 million to \$2,014 million in 1991, \$2,116 million in 1992, \$1,726 million in 1993 and \$640 million in 1994. A temporary reprieve in 1995 took the inflow to a

reasonable \$ 2,300 million. While FDI inflows were slowing, exports were not growing fast enough to finance burgeoning imports. As a result, after taking account of FDI inflows, the current account deficit left to be financed from other sources has risen to an estimated 7.5 per cent of GDP. The 'structural deficit' in Thailand's current account stemming from the openness of its economic regime, was no longer accompanied by adequate inflows of private direct foreign investment.

To finance its external deficits, therefore, Thailand had to resort to borrowing from international credit markets, implying a rapid increase in external debt from \$ 23 billion in 1989 to more than \$ 60 billion in 1994, amounting to nearly half of GDP. Much of this was necessarily short-term debt, which is very susceptible to the level of investor confidence. Financial markets had been concentrating on the rate of export growth as the single most important indicator of creditworthiness, rather than the external imbalance, and once the export deceleration led to an increase in the projected current account deficit, the run on the baht began.

The Malaysian-case is similar, even though it has not experienced a balance of payments crisis like that of Thailand, Malaysia has benefited from much higher FDI inflows than Thailand, which has meant that the current account deficit to be financed from sources other than FDI has been more limited at 3.8 per cent of GDP in 1995. Nonetheless, the recent export deceleration has also increased Malaysia's reliance on borrowing, and the external debt-to-GDP ratio has risen to 39 per cent. Malaysia's principal problem is that because of large outflows on account of consumer goods imports, the current account deficit has been large even in years of relatively good export performance, and tends to widen sharply in bad years like the current one. As a result, in recent times the Malaysian currency, the ringgit, has reflected the pressure stemming from the current account deficit. As in the case of Thailand, the blame cannot be laid on fiscal imprudence: the Malaysian government's budget is expected to register a surplus this year. In response to the potential crisis, the government has already said it may impose quotas and import permits to curb imports of nonessential goods.

Similar rumblings are also evident in Indonesia, which currently runs a current account deficit amounting to 8 per cent of GDP, and whose inward FDI also has been declining after a peak in the early 1990s. Here too, the external debt amounts to nearly 40 per cent of GDP. In fact, the potential for disaster is greater than that in Thailand or Malaysia, because official foreign exchange reserves in Indonesia are barely adequate to cover three-fourths of its short-term foreign debt. Thus, if a speculative run on the rupiah

occurs, the Indonesian government will be forced to seek direct help from its traditional patrons, the US and Japan, since it simply cannot cope with any crisis on its own. The economy of the Philippines has always been the weakest of these four, and it has weathered an earlier debt crisis in the 1980s. Its current difficulties are no less intense than those of the other countries, although they may appear less sharp simply because the Philippines was never touted as a major economic success story along the lines of its ASEAN partners.

#### **IMPLICATIONS**

The story of the south-east Asian NICs is by no means over Yet the process that has already unfolded does contain important lessons for other developing countries in Asia The first is that relocative investments can play a role in increasing output and employment, but there is no evidence that they will occur in sufficient quantity and quality to affect an industrial transformation as projected in the flying goese model. In fact, if excessive reliance is placed on FDI then reversals or declines in such inflow can play havoc with the industrialisation process Ultimately there is no alternative to increasing rates of savings and investment domestically

Second the advantages of cheap labour are fundamentally ephemoral. Even if a

country is recognised as an attractive site for FDI at one point of time, there is no guarantee that it would remain so for long, especially when alternative attractive sites (in terms of cheap labour) are available in abundance. Nor is it the case that FDI always responds positively to fiscal and other incentives offered by desperate governments. Rather, the evidence seems to indicate that FDI typically goes where it is needed the least, that is where a sustainable growth process is already under way.

Third, liberalisation of economic policies which is aimed at attracting FDI need not have the desired affect, but it can still lead to other undesired consequences. Thus in developing countries it typically results in a large inflow of imports that may not be matched with exports. Furthermore it permits domestic entrepreneurs to borrow in international markets to finance projects (for example in infrastructure) that yield only domestic currency revenues. This can create the seeds of future balance of payments and debt repayments difficulties.

Fourth, and related to this, any source of external financing other than relocative FDI even if it is available in amounts ade quate to finance a current account deficit and build official reserves, tends to increase external vulnerability if it is depended upon for long periods of time. The irony is that

policy packages that are designed to attract relocative FDI are also those which set in motion these other forms of external vulnerability

Finally the widespread belief that stable and prudent macro-economic policies and high domestic savings rates are adequate guarantees against rising current account deficits is false, as clearly indicated by the examples of Thailand and Malaysia In both of these countries, the current account deficit has been rising despite budget surpluses of the government This has reflected private sector decisions about the structure of consumption and the level and composition of investment, which governments have ceased to try and direct because of their commitment to neo-liberal marketfriendly policies In a financially liberalised world this also means that private decisions about borrowing affect a country's external debt position, and render it vulnerable in ways that a government may not anticipate

The experience of these south east Asian countries indicates that it is the structure of economic growth, and not whether or not it is dominated by government that can create a predicament for a so called successful industrialising economy. This is a lesson that those in other Asian countries can ignore only at their own peril

# On the occasion of its 25th anniversary

AC IONAID India announces

# The ACTIONAID INDIA AWARD

For

# BEST PRACTICES CASE STUDY

On

# PARTICIPATORY DEVELOPMENT

PRIZES.

1st Rs.15,000/- 2nd **Rs.10,000/-**

3rd **5.000/-**

## **DETAILS:**

- \* The case study should be between 3000 and 5000 words and based on the personal experience of the author in Participatory Development. It should be accompanied by original drawings, maps etc. in publishable form Contributions should be in the field of development in the NGO and government sectors.
- The case study should not have appeared in print earlier
- Award winning entries as well as others witch have been shortlisted would be published in a book by mid '97
- Award winners as well as others whose entries have been shortlisted will be expected to make presentations of their studies in July 1997
- \* The decision of ACTIONAID India will be final For further details write to

The Director, PRA Division,

D-6, Blessington Apartments, 34, Serpentine Street, Richmond Town, Bangalore - 560 025

All entries should be sent to the above mentioned address

Last date for entries: December 15th 1996.

# **Clueless against Emerging Recession**

The RBI's conventional approach, reiterated in its latest Annual Report, of tinkering with reserve requirements and signalling monetary policy changes through open market operations may achieve the objective, to which the RBI evidently attaches the highest importance, of establishing closer links among the money, capital, gilt and foreign exchange markets, but it will certainly not help stimulate the dynamic role of credit in the development of the economy.

### I The Macro Scene

THE operations of the financial system have begun to reflect some distinct signs of a slow-down in overall industrial activity. In the real economy, the reduced rate of industrial growth does not fully reflect the arresting of the tempo of activity. The growth of infrastructure industries has suffered badly, many industrial projects have been kept on hold, and there are clear indications of stockpiling of finished products and growing receivables amongst corporates. Even the persistence of a reasonably low level of inflation is attributable to reduced demand for manufactured goods. Apart from the deleterious effects of unprecedentedly high real rates of interest, the reduced flows of bank credit and institutional finance into the industrial sector reflect both the cause and consequences of the subdued tempo of economic activity; slower exports of manufactured goods also seem to display the same phenomenon.

A major contributory factor for the sluggish economic activity appears to be reduced aggregate demand in the economy which has originated in the cutback in public expenditure with a view to projecting a better fiscal scenario. An indication of this is to be seen in a drastic drop in the central government's resort to ad hoc treasury bills from the Reserve Bank of India (RBI). From a peak of Rs 22,095 crore as of July 5, there has occurred an unusual turnaround in the use of ad hoc TBs in the most recent period; such use has dipped to a negative figure of Rs 1,175 crore as on September 27, 1996 against the rise of Rs 6,440 crore in the comparable period last year. Such a remarkable turnaround could not have happened but for some compression of public expenditure by the central government. Of course, to an extent the government's borrowing programme has run at a faster pace than last year. Though RBI credit to the central government has declined from Rs 9,688 crore during April-September 1995 to Rs 5,662 crore during April-September 1996, other banks' credit to government (central and states together) has shot up from Rs 6,861 crore to Rs 14,664 crore. But at the same time, during the first half of 1996-97 revenue receipts have remained considerably sluggish, particularly under union excise duties and direct taxes. The annual growth in direct tax receipts during April-September has slowed down to 11 per cent compared to the year's target of 17 per cent. Likewise, excise duty receipts during April-August grew by 8.7 per cent against the target of 14.4 per cent.

A disquieting aspect reflecting the sharp dip in investment intentions is seen in a reported 20 per cent absolute fall in financial assistance sanctioned by the all-India termfinancing institutions. During April-July 1996, their sanctions aggregated Rs 12,930 crore against Rs 16,551 crore during the corresponding period of 1995. The first quarter of the year of course, saw a 40 per cent rise in financial disbursements but the rise was over a low base, for the rate of increase in disbursements had actually dropped from 22.9 per cent in 1994-95 to 12.4 per cent in 1995-96. Funds mobilised from the capital market by the corporate sector during April-September 1996, at Rs 8,103 crore have also been only fractionally higher than the Rs 7,989 crore raised during the comparable period of 1995-96. In 1995-96 the level of funds mobilised by non-government public limited companies. government companies, PSUs and financial institutions at Rs 22,919 crore was about 26 per cent lower than that (Rs 30,824 crore) in 1994-95. There has been some shift in favour of debt instruments but the authorities have recognised that debt fatigue has set in among the investors as evident from the fact that such triple-A rated companies as TISCO and L & T were hard put to secure subscription for their bond issues of Rs 500 crore each. Mutual funds, including the UTI, have also mobilised a lower amount of Rs 1,299 crore during April-September this year against Rs 2,200 crore in the same period last year. During the year 1995-96 as a whole, net collections by mutual funds were a negative figure of Rs 5,141 crore due to large redemptions of many UTI funds; in 1994-95, they had collected Rs 11,275 crore in net terms.

A more complex aspect of the financial scene during the recent period concerns the contraction in bank credit. Between March 31 and September 27, advances of scheduled commercial banks experienced an absolute fall of Rs 3,945 crore (-1.5 per cent) compared with a rise of Rs 10,228 crore during the same period of 1996-97. As is evident from the banks' deposit growth and deployment of funds in investments of government and other approved securities, the short-term liquidity situation appears comfortable and yet there has been a large reduction in credit offtake, which can be only partly explained in seasonal terms. Both the supply and demand factors seem to have triggered this phenomenon. On the supply side, the banks have been charging unusually high rates of interest for commercial loans and preferring government securities for deployment of funds. It is now recognised that the recent Supreme Court judgment casting full responsibility on bank officials sanctioning loans has had an adverse effect on decision-making by the banking bureaucracy. On the demand side, the corporates are reluctant to borrow from banks partly because of the high rate of interest and partly because of the sluggish industrial activity.

# POLICY PERSPECTIVES

The root cause of the current impasse is the premature liberalisation of interest rates which has produced unbridled competition amongst banks, financial institutions and non-banking financial companies (NBFCs) for mobilising scarce financial assets of the community. It is now proven beyond doubt that high real interest rates have of late hurt production and investment activities in the industrial sector without, at the same time, producing benefits in terms of any rise in

financial savings. Depending solely on conventional stabilisation and structural adjustment programmes, the monetary authorities have responded to the complex situation by injecting larger liquidity through reductions in reserve requirements. The effective CRR has been brought down from 15.7 per cent in March 1995 to 11.5 per cent in July 1996. Instead of helping improve credit offtake by reducing average interest rates, and promoting commercial credit expansion, scheduled commercial banks have used the excess liquidity to increase their investments in government securities (as indicated above) and, more significantly, to drastically curtail their export refinance from the RBI. Since March 31, banks have surrendered over Rs 15,000 crore of investible funds available in the form of RBI refinance - an unimaginably large loss for the productive sectors.

Despite the all round recognition and the crying need for reducing average interest rates for banks and financial institutions, expanding both short-term and long-term credit offtake, and helping to improve the tempo of economic activity, the RBI in its latest Annual Report for 1995-96 continues to place faith in monetarist perspectives of breaking price expectations and hoping that "nominal interest rates would eventually decline". The reduction in CRR, which the RBI recommends, may be necessary but not enough of a measure to break the impasse of high cost of funds, high lending rates and reduced credit expansion. The situation calls for reimposition of interest rate regulations for bank deposits and lending and also for inter-bank money market borrowings; this

will have to be followed up by definitive norms for the inter-sectoral distribution of bank credit, as also for credit drawals by medium- and large-scale industries. Mere injection of CRR funds would not expand the community's savings and competition amongst banks and institutions would persist, pushing up the rates of interest. Secondly, the RBI ought to have reconsidered its narrow perspective on sector-specific refinance and deployed the refinancing arrangement as a potent instrument of credit policy with twin objectives of stabilisation and promoting sectoral growth, both by modulating the supply of funds and their cost at the margin. Again, in this regard, the RBI has chosen to tread the conventional path, as reiterated in its Annual Report of "reducing reserve requirements and reducing refinance limits" and of signalling monetary policy changes through open market operations. Such a strategy may result in massive treasury operations and bring closer the links between money, capital, gilt and foreign exchange markets which the RBI has sought to commend in its Annual Report, but it would have less social relevance and certainly would not help stimulate the dynamic role of credit in the process of development; it would rather hinder the latter.

#### OTHER POLICY DEVELOPMENTS

As a major liberalisation measure, the union finance minister, while granting a number of tax concessions to buoy up the capital market, announced that Fils operating dedicated debt funds would be permitted to increase their investments in debt instruments.

from the present 30 per cent to 100 per cent of their funds. FII investments in government securities, however, remain prohibited. This measure along with the permission granted to FIIs to invest in unlisted companies is expected to facilitate creation of separate funds for infrastructure projects. The SEBI would issue detailed guidelines regarding the sinvestment limit of each FII (roughly \$100 million) and the cap to be fixed for all FIIs together (reportedly \$1.5 billion). It is unlikely that FIIs would be allowed to invest in short-term debt instruments of less than one year maturity.

Secondly, the six primary dealers (PDs) authorised by the RBI have created a selfregulatory organisation so that they observe certain discipline in their operations. This was found necessary because there have been severe criticisms when some of the PDs have passed on the benefits of commission with their parent banks who preferred to route their bids for government paper through the PDs. The RBI has frowned upon such a practice and made it clear that the commission offered was intended for facilitating the PDs to fulfil their role as market makers until the PDs came of their age. Apparently, the PDs have now decided to dispense with the practice of sharing their commission with investors, including their parent banks.

# II Operations of Primary Markets

The primary debt market in September was dominated by bond issues of manufacturing firms and financial institutions,

GRAPH B: SPOT QUOTATIONS FOR THE US DOLLAR IN THE DOMESTIC INTER-BANK MARKET

with the government having achieved a substantial part of its borrowing programme in the early part of the year. A major motivation for the corporates to prefer bonds has been the unusually high rates of interest charged by banks and FIs on their loans. Bond and debentures issued by corporates, PSUs, government companies and banking and financial institutions had aggregated Rs 10,550 crore during 1995-96, which is expected to jump to a range of Rs 20,000-25,000 crore during the current year. A large number of manufacturing firms are also in the fray this year. PSUs alone are slated to raise over Rs 10,000 crore during the year as against Rs 2,082 crore during 1995-96. Such a heavy demand for debt instruments in a period when banks have preferred to surrender their refinance facilities with the RBI, will imply that yield rates on government securities including treasury bills will remain high as has been shown in the September floatations, and that the government's programme of disinvesting PSU shares may suffer a setback.

#### **DATED GOVERNMENT SECURITIES**

The government came to the market only once during September, seeking to float for the first time during the current financial year a medium-term paper. It sought to raise Rs 2,000 crore through a six-year paper which was auctioned on September 17. It was in July 1994 that the government had come up with a six-year paper on the earlier occasion.

Despite offering such a high yield rate as 13.82 per cent compared with 13.85 per cent offered for a 10-year paper less than a month earlier on August 26, the market has shown lukewarm interest in this paper. In 82 bids, its contribution was Rs 1,611.10 crore. The Reserve Bank accepted 43 bids which brought in Rs 1,026.10 crore or 51.31 per cent of the notified amount. The Reserve Bank and the primary dealers took the slack and contributed Rs 872.61 crore and Rs 101.29 crore, respectively. This poor response once again demonstrated a few important features: the market's

appetite for insisting on high coupon rates; its reluctance to invest in long- or even medium-term securities; and the government is being pushed by the process of liberalisation into high interest cost leading to high debt. Also, due to lack of interest in medium- and long-term papers, the yield curve on the primary government paper has remained distorted this year (see table below)

| Tenure of the paper (No of Years) | Coupon Rate<br>(Per Cent) |
|-----------------------------------|---------------------------|
| 2                                 | 13 62                     |
| 3                                 | 13.70                     |
| 4                                 | 13.72*                    |
| 5                                 | 13.75                     |
| 6                                 | 13.82                     |
| 10                                | 13.85                     |

<sup>\*</sup> Zero coupon bond

Foreign banks reportedly did not participate in the auction but subsequently bought the paper from the PDs. With 50

Period to Maturity in Ascending Order

paise commission apparently shared with them, the yield on this paper worked out to

13.95 per cent.

The market also paid the last instalment of Rs 1,250 crore for the partly-paid security floated in June. Subsequently, the government offered on September 25, sale of one more issue of Rs 2,000 crore zero coupon bonds (third series) maturing 2000. To be sold on October 7, the bonds were offered at a discounted price of Rs 60.66 or the cut-off yield of 13.31 per cent, at which the same bonds were issued early this year.

#### 364-Day TBs

In two auctions of these TBs, the government raised Rs 516 crore during September (Table 1). Despite significant improvement in short-term liquidity, the cut-off price has remained constant at Rs 88.80 giving an YTM of 12.61 per cent for the third month in succession.

## 91-Day TBs

Further Rs 2,000 crore were raised through four auctions of 91-day TBs during September. With the commercial banks preferring to surrender their refinance with the RBI (borrowed at 11.5 per cent), the money market conditions became relatively tight. Hence, the market response to this paper sharply declined and the YTM offered steadily increased in September, thus reversing the declining trend in yield noticed since April. In fact, in three out of four auctions, there was no devolvement only because of the non-competitive bids. They bid for as much as Rs 2,600 crore. Nevertheless, between the first auction and the last auction held in this month, the yield on this paper had to be increased by 21 basis points; it went up from 9.96 per cent to 10.17 per cent. From the market, only Rs 469.50 crore were raised. Of the balance, Rs 1,380.50 crore were contributed by non-competitive bidders and in one auction the Reserve Bank and PDs contributed through devolvement Rs 129.60 crore and Rs 20.40 crore, respectively.

The Reserve Bank has been, for the past couple of months, announcing the weighted average price on 91-day TBs along with the cut-off price. It has been found that initially in August the weighted average yield considerably lagged behind the cut-off yield reflecting a general tilt in favour of lower yields but in September this gap has been narrowed implying a firming up of the preferred yield (Table 2).

# **Bonds Market**

The bonds market boom which began around the beginning of April 1996, gathered momentum during September. Issues of high-rated corporates such as, TISCO, L&T, and

Arvind Mills dominated the market However, surprisingly even with high yield offers of over 17.15-17.44 per cent by TISCO, 17.12-17.49 per cent by L&T, and 18.26-18.33 per cent by Arvind Mills these bonds barely scraped through. TISCO was torced to raise the front-end discount to 3 per cent, following which L&T raised the discount to 2.8 per cent and Arvind Mills to 4 per cent. ACC also entered the market for a five-year bond with an effective yield of 18.27 per cent. The difficult sailing of these issues was to an extent attributable to their bunching. After large issues of IDBI, ICICI and IFCI, the market found it difficult to support three additional large issues of the private sector.

The market was caught off-guard when IDBI offered 16 per cent for one year for its Omni Bond V series and 16.5 per cent plus one per cent commission on its 3-year bonds, totalling Rs 300 crore to be closed on October 31, 1996. With the growing competition, ICICI privately placed bonds for 15 months at a yield of 16.3 per cent and 3 years at a yield of 17.7 per cent, IFCI,

<sup>\*</sup> Data for reporting Fridays (RF) are omitted.

a regular borrower, also entered the market to mobilise unlimited resources by providing yield rates of 17.8 per cent. After FIs and top-rated companies, now state financial corporations have started entering the debt market. During September, Haryana Finance Corporation intended to raise Rs 50 crore through 6-year SLR bonds at a yield of 19.18 per cent. Similar amount was raised by Punjab State Industrial Development Corporation through 5-year SLR bonds at yield of 17.84 per cent. Also, Rajasthan state electricity board placed privately SLR bonds at very high yield of 19.02 per cent. In addition, MPFC also chose to raise Rs 17 crore through 10-year SLR bonds at 13.85 per cent. These state-level bond issues scraped through after strong pursuance by respective state governments as the investors are very wary of such issues. Recently, state government guaranteed bonds raised by the SEBs of West Bengal, U.P. and Bihar had delayed their debt repayments.

The spirit of issuers, however, is far from dampened. Following the private sector, large PSUs, such as, IPCL and Coal India are likely to tap the bond market in the near future. IPCL will enter the market with its Rs 300 crore non-convertible debenture issue along with Rs 200 crore worth of deposit offer. Coal India is planning to raise Rs 400 crore. Bond issues by financial institutions like IDBI, ICICI, IRBI and Krishna Valley with their sizeable offerings and corporates like Escorts and Sanghi Polyesters with their moderate offerings are further on the anvil.

The sudden resurgence of the debt market has been induced by the unusually high rates of interest charged by banks and FIs and the simultaneous depression of the share markets. Corporates have obviously found it cheaper and easier to borrow through bonds and the investing public gets attractive returns. Yields of 16 to 18 per cent per annum on bonds issued by Fls, 18 to 19 per cent on taxable bonds of PSUs and 20 to 24 per cent on NCDs of private companies, have tended to place the equity market at a discount. The only competition now faced by corporate bonds are the deposit rates offered by NBFCs which range from 18-20 per cent. Many of the NBFCs seem to violate the RBI guidelines whereby only the registered and rated companies are freed from the 15 per cent deposit rate ceiling.

The continued buoyancy of debt market was further boosted by the recent liberalisation policy measures, such as, first, permitting the FIIs to invest 100 per cent of their dedicated debt funds in bonds, debentures and other commercial debt instruments; secondly, individual investor's access to bank funds against shares and debentures was doubled from Rs 5 lakh to Rs 10 lakh; and thirdly, the investment made in the CBDT notified bonds and debentures through mutual funds up to 3 years would be exempt from capital gains tax under Section 54E of the Income-Tax Act.

As the debt market expands, it is also

undergoing significant transformation. First, contrary to the earlier practice of plain, vanilla type of bond issues, the recent period has witnessed multi-option, family bonds to cater to the asset preferences of investors. Among these instruments, deep discount honds (DDBs) are much sought after due to the advantages of no tax deduction at source, initial below par payment and the scope of availing capital gains tax if sold in the secondary market before maturity. Also several innovative characters are being attributed to debt instruments, such as, frontend discounts, early bird incentives, redemption premium, put and call options, facility for housing loans, etc. Of course, many of these offerings commit the borrowing institutions to high-cost funds on a long-term basis which has implications for their lending rates.

Secondly, further innovations were added to the debt market when the ministry of finance permitted ICICI and SCICI to go in for (i) self-registration which would do away with the delay associated with frequent vetting by SEBI, and (ii) bonds on tap which will help companies to mobilise resources as per the availability of liquidity in the system at cheaper rates. Thirdly, the debt market is noticeably dominated by a spate of issues of NCDs by private corporate sector, mostly led by NBFCs. Most of these issues are for shorter maturity of 18 months and less, so as to obviate the SEBI's mandate of rating required for longer maturities. The market is likely to get additional boost with the expected permission of SEBI to allow rollover of debentures before 18 months. Currently, SEBI's rules permit rollovers for 18 months to 36 months, but do not explicitly

ban others. Fourthly, the process of book building is the current fashion of resource mobilisation through private placements. Book building is a process of share price fixation based on realtime feedback from bulk investors. Finally, the debt instruments have become more liquid following the BSE's introduction of on-line trading of 698 debt instruments out of 1,700 and add listed instruments, effective from September 10, 1996.

### Other Instruments

The interest rates on CDs dropped to a low of 9-10 per cent. As banks refused to roll over the CDs thanks to a robust growth in deposits, the investors had to look for other attractive avenues to invest their surplus cash. The corporate sector's interest in commercial paper (CP) was renewed as it could form a cheaper resource avenue at a time when banks were unable to lower their interest rates beyond a point. There were not many issues as without a standby facility. but now the instrument has rendered itself riskier. Corporates were also complaining of the delays encountered in obtaining no objection certificate from the bank consortium leaders for issuing CPs. As a result the corporate sector was found stuck with high-cost cash credit.

The inter-corporate deposit (ICD) market has been experiencing lack of confidence for some time now. During the credit squeeze of the last financial year, many corporates had defaulted or delayed repayments of their ICDs. As a result, the market had become extremely wary of lending through this unsecured route. Last month, there were reports of arrest warrants issued to the chief executives of two well known corporate

<sup>(-)</sup> means no trading YTM = Yield to maturity in percentage per annum CY = Current yield in per cent per annum \* Yield rates of these sub-groups of t-bills and dated securities have been used for the graphs.

Notes:

1) Yields are weighted yields, weighted by the amounts of each transaction.

2) Current yield has not been worked out for treasury bills.

houses for defaulting in ICD repayment. This confounded the nervousness of the market. The outstanding volume as a result of this has fallen from the peak of Rs 4,511 crore in August 1994 when this market was in full bloom to Rs 234 crore in July 1996; it had touched the lowest level of Rs 71 crore in April.

# III Call Money and Foreign Exchange Markets

Call Market

The call market ruled firm during September except for the customary drops in the rates on reporting Fridays (Graph A). The rates inched up from the 3-5 per cent range of the past couple of months to reach only slightly below the 11 per cent barrier by the middle of the month where they remained for the rest of the month (Table 3).

The indications of firming up of rates were visible in the first fortnight of the month when the rates moved up to 5-6 per cent levels in anticipation of the tightness in the following fortnight. As against an inflow of Rs 4,000 crore by way of coupon payments and treasury bills redemption, the outflow was sizeable at around 11,000 crore towards advance tax payments (Rs 6,300 crore), government loans (Rs 2,250 ctore), and treasury bills subscription (Rs 2,400 crore) One holiday (September 16) also influenced the expectations. All these factors took the rates up to 10.25/75 per cent levels. The 11 per cent export refinance barrier, however, was not breached as the robust deposit growth matched the outflows Towards the last week of the month, rumours of a hefty cut in the cash reserve ratio of banks prompted them to arbitrage between the calls and the giltedged market. The rates nevertheless kept steady at 10.25/75 per cent levels. Overall, the volatility in call rates was the least during September (Table 4).

# Foreign Exchange Market

The spot market largely remained stable during September as demand was more or less met by supply. The rupee moved in the narrow range of Rs 35.67/87 a US dollar. The Reserve Bank supported the rupee at these levels with frequent buying of small amounts. With a view to shoring up official reserves to service the bunching of obligations towards the end of the year. Interestingly, though the demands were large as some repayments on account of IMF obligations, maturing FCNR (A) deposits and forward liabilities undertaken by the Reserve Bank during the volatile phase in February this year were due, the rates did not see much volatility as supplies matched the demand and did not allow pressure to build up on the currency. During September, inflows of foreign exchange had increased on account of higher FII investments flow, GDR issues and FDIs.

The forward market, however, reflected much volatility especially at the short end (Graph C). This was largely on account of interest rate uncertainty. In fact, rumours of a likely CRR cut dampened the one-month forward premia in two weeks during the month. The benchmark six month premia have remained stable at around 10 per cent.

## IV Secondary Markets in Debt Instruments

Government Paper

The firming up of call rates and rumours of further CRR cut gave a boost to trading volumes in government paper during September. Interest in the secondary market for dated paper continued to be in papers at the shorter end. The 13.50 per cent 1997 paper and 13.62 per cent 1998 paper were by far the most popular. Due to higher interest in this paper, the price of short maturity papers fell by at least 12 to 15 paise raising the yields by 15 to 20 basis points. With a possibility of a fall in interest rates, trading in zero coupon bonds also picked up. The price of zero coupon 1999 had already appreciated by 56 paise and that of zero coupon 2000 by 37 paise. Softening of interest rates would result in further appreciation in these papers. An important factor was the commission sharing system after the auction of 13.82 per cent government stock, 2002 on September 17. The total trading volume on this security alone was considerably large at Rs 711.64 crore during the week ending September 20. Thirdly, the clarification of CBDT regarding zero coupon bonds that such bonds if sold before maturity would attract only capital gains tax, gave a big push to the secondary market trading in zero coupon bonds. Consequently, the total traded value in such gilts stood at a very high level of Rs 454 crore during September. Trading volumes in long-dated papers have been low and the yield range has been around 13.90-14 per cent.

Rumours of an inevitable CRR cut gave fresh impetus to the securities market as banks preferred to lock themselves into high yielding government paper rather than keep cash for lending at low rates in the call market; there is also some reluctance to increase commercial credit. Foreign banks were notable players in this game although their interest was restricted to short dated paper. The nationalised banking sector thus could sell some of its excess SLR securities. Foreign banks which have bought securities at lower price currently are hoping to sell them at higher prices on a later date as the security prices are expected to rise on buying interest after CRR cut.

Hardening of call rates also increased the dependence on repo market quite significantly. This was evident from the fact that on several occasions, especially on reporting Fridays, repos worth over Rs 500

crore were recorded in SGL account (see Appendix Table). The duration of the repos varied from 3 days to 14 days and the reporate ranged between 4.80 per cent for 3 days to 10.85 per cent for 14 days. Expecting high call rates to prevail in the short run, banks preferred to cover themselves with borrowings through repos as cash borrowings on reporting Fridays attract reserve requirements whereas borrowing through repo does not. Interest in TBs was across the maturity spectrum in 91-day bills and was confined to bills maturing in July-August 1997 in 364-day TBs.

Yield Curve

A distinct aspect of the yield curve behaviour during August 1996 was its flatness both in the primary market offerings and in secondary operations. This had reflected a situation of sharper increases in short-term rates with practically no increases in long-term yield-rates. Theoretically, the flatness of the yield curve also indicated that both short-term and long-term rates remained relatively high. In September, the yield curve depicting the primary offerings of government paper remained flat suggesting the persistence of the phenomenon of high yield rates offered on short-term and longterm papers. However, in the secondary markets, there has occurred some fall in short-term yield rates in September unlike in the long-term ones, as a result of which the yield curve appears upward sloping and normal (Graph D).

### **Open Market Operations**

The Reserve Bank purchased Rs 90 crore worth of zero coupon bond 1999 at its purchase price of Rs 72.50 in mid-September. Barring these trades, there was no buying or selling activity under the open market operations. Notably, the Reserve Bank included in its price list, the offer to purchase the Gold Bonds 1998 since September 14. At a price of Rs 4443.21, the purchase offer of RBI was attractive. It is, however, surprising that despite offering good returns, the Reserve Bank has not been able to purchase a single bond so far. The lure of yellow metal could well be the reason for this.

### Other instruments

The volume of trading in the secondary market in CDs and CPs was extremely limited. There was one deal of Rs 5 crore each in CDs of IFCI, ICICI and Times Bank according to the NSE data. Commercial paper of Kitply also changed hand once. Among the PSU bonds (Rs 68 crore) and debentures (Rs 25 crore), the traded amounts on the NSE were similar to the previous month (Table 5)

[The supporting review and statistical compilations for this paper were undertaken by V P Prasanth and Rafiq L Ansari]

# Protecting Plant Varieties: UPOV Should Not be Our Model

Suman Sahai

As a matter of strategy, it makes sense for India to draft a wide-bodied law for protection of plant varieties without accepting the restrictions of UPOV. In this way, when TRIPS comes up for review in 1999 and the pressure mounts to tighten our intellectual property regime further, we will have more space to negotiate.

THE agriculture ministry has just concluded a joint meeting in Delhi with UPOV officials. The purpose was to discuss the UPOV Plant Breeders Right (PBR) as a model for India's sui generis system to protect plant varieties. UPOV stands for the Union for the Protection of New Plant Varieties. It is the organisation which since 1961 has been formulating and granting PBR. UPOV is based in Europe and its members are industrial countries. The UPOV model is not the model that India should adopt as its sui generis system.

The GATT/WTO requires every member country to provide either a patent or an effective sui generis system to protect newly developed plant varieties. Nowhere doe, it state that WTO members have to follow the UPOV model. Bureaucrats concerned with TRIPS are however advising their political leaders that India must adopt UPOV and accede to the UPOV treaty of 1978. This unfortunate mesmerisation with things western will not serve us well.

We should devise our own sui generis system. It is possible to build greater flexibility into what is defined as sui generis in TRIPS than there would be in accepting a precast UPOV model. As a matter of strategy, it makes sense for us to draft a wide bodied law now without accepting the restrictions of UPOV. In this way, when the TRIPs comes up for review in 1999 and the pressure increases to tighten our intellectual property regime further, we will have more space to negotiate.

Apart from the fact that the UPOV system is based on components that are alien to us, it is far too expensive. Calculating at today's exchange rates, the costs of testing, approval and acquiring an UPOV authorised Breeders Right certificate will amount to something like Rs 2 to 3 lakh at least. This could go up to Rs 8 to 10 lakh. These rates will effectively preclude the participation of all but the largest seed companies. There certainly will be no space in such a system for small companies, farmers' co-operatives or farmer/breeders.

Another factor that goes against accepting the UPOV system is the fact that once we are in the system, we shall be forced to go in the direction that UPOV goes. If not today, then tomorrow. The writing on the wall in UPOV is clear. It is a system headed towards outright patents. Starting with its first amendment in 1978 when limited restrictions were placed on protected seed, the 1991 amendment brought in very strong protection for the plant breeder. In this version, breeders are not exempt from royalty payments for breeding work and the exemption for farmers to save seed has become provisional.

UPOV now also permits dual protection of varieties, that means in the UPOV system, the same variety can be protected by PBR and patents. It would seem obvious that UPOV is ultimately headed towards patent protection for plant varieties. It would be wise for India to stay out of a system which has plant patents as its goal since that is neither our goal nor our interest.

For the information of those not familiar with how breeding work takes place and how new varieties are released, farmers play a significant role as breeders of new varieties. They often release very successful varieties by crossing and selection from their fields. These varieties are released for use as such. In addition, in almost all cases, these varieties are taken up by agriculture universities as breeding material for producing other varieties. Such farmer/breeders would not be able to participate in an expensive system like UPOV.

Their material along with their labour and innovation would be misappropriated by those with the money to translate such valuable permplasm into money-spinning varieties registered in UPOV. Poor farmers unable to pay the costs of getting an UPOV certificate, would tend to sell their varieties for small sums to larger seed companies. This will be the ultimate irony, creating an institution that will snatch away from the farmer his material and his opportunities.

Essentially the UPOV system is wrong for us because it embodies the philosophy of the industrialised nations where it was developed and where the primary goal is to protect the interests of powerful seed companies who are the breeders. In the UPOV system, rights are granted only to the breeder, there is nothing for the farmer. In India the position is very different. We do not have big seed companies in essential seed sectors and our major seed producers are farmers and farmers' co-operatives.

Logically, our law will have to concentrate on protecting the interests of the farmer in his role as producer as well as consumer of seed. The philosophy of our seed law has to be distinctly pro-farmer and pro-rural. It must clearly reflect the fact that India is a germplasm-owning country whose farmers have contributed in an important way to the conservation and refinement of this germplasm. None of this features in the UPOV system.

UPOV laws are formulated by countries which are industrial, not agricultural economies. In these countries the farming community is by and large rich and constitutes from 2 per cent to 7 per cent of the population. These countries do not have the large numbers of small and marginal farmers like we do.

What is more, UPOV laws are framed in countries with a completely different agriculture profile from ours. These are countries where subsidy to agriculture is of a very high order unlike India. Because they produce a massive food surplus, farmers in industrialised countries get paid for leaving their fields fallow. The UPOV system does not have to protect the farming community of Europe in the way that our seed law will have to protect ours.

In Europe agriculture is a purely commercial activity. For the majority of Indian farmers however, it is a livelihood. These farmers are the very people who have nurtured and conserved genetic resources. The same genetic resources that breeders want to corner under Breeders Rights. We must protect the rights of our farmers and these rights must be stated unambiguously in our sui generis legislation.

The nature of agricultural research in India is also different from that in Europe and other industrialised countries. Almost all agricultural research and plant breeding in India is financed with the tax-payers' money It is conducted in public institutions like agricultural universities and institutions of the Indian Council of Agricultural Research (ICAR). This research belongs to the public.

The laws of UPOV on the other hand are formulated by societies where seed research is conducted more in the private domain than

in public institutions; where big money is put into breeding using recombinant DNA technology which is expensive. Because they invest in expensive breeding methods and need to secure returns on their investments, seed companies in Europe seek market control through strong IPRs. These conditions do not apply in India.

India's seed law must emphasise that it is a germplasm-owning country. Its position should be that seed companies wanting protection for plant varieties through PBR will first have to pay for the genetic material used by them. Genetic resources like other natural resources are a source of revenue and must be paid for. The economic value of genes can be assessed by case studies in order to help fix a price for their use.

India's sui generis system must recognise the Farmers' Rights, which is absolutely different from the farmers' exemption to save and sell seed under the older UPOV rules. Even now, there is confusion among officials on this score. Farmers' Rights refers to the rights of the farming community of the third world in creating and maintaining the genetic resources of the world. It is in acknowledgement of this stupendous contribution that the FAO passed the Farmers' Rights bill in 1988. This bill acknowledges that the contribution of farmers is on parwith those of the breeder and if one is to be rewarded by a Breeders' Right, the other must be rewarded by a Farmers' Right.

In June 1996, the Food and Agricultural Organisation (FAO) held a meeting in Leipzig in which the principle of Farmers' Rights was strengthened. There is also a commitment that new and additional funding will have to be found to honour Farmers' Rights. India should build on this progress by being the first country to incorporate Faremrs' Rights into its Plant Variety Act.

In addition to Farmers' Rights, our law should require use of germplasm and indigenous knowledge about that germplasm to be paid for. The farmers must continue to have complete freedom to use, reuse, sell and modify seed. Scientists and breeders should have unrestricted access to germplasm for breeding new varieties.

Our law should be distinctly supportive of sustainable agriculture and conservation of genetic resources. It should encourage genetic diversity in the field by promoting release of several varieties. Instead of a few large seed companies pushing their few successful varieties, a decentralised seed industry should be established in rural areas. Such regional seed producing units will be able to produce region specific seeds far more effectively. Our sui generis system will finally have to ensure the country's food security and the livelihood of farmers.

India should seize this initiative to do some creative thinking and craft a creative and sensitive sui generis legislation to present the viewpoint of the south, emphasising the strengths of the south. If India succeeds in doing this, it will provide an alternative sui generis model for all developing countries to follow. In time, with successful lobbying,

such a legislation should succeed in ending the era of gene-exploitation by demanding the true rights of countries that have been the developers and custodians of the genetic resources of the world.

# A Rare Man

**Ashok Mitra** 

A generation ends with the going of Satya Brata Sen, a generation which believed that the focus of the nation's affairs deserves to be exclusively on expanding the welfare of the hundreds of millions of countrymen made up by the peasantry and the working classes. A scientific approach, besides, must also inform, in the view of the same generation, the analysis of problems and issues which affect the common people.

SOME six decades ago, in a couple of rooms non-formally appropriated from the Baker Laboratory in Presidency College, Calcutta, P C Mahalanobis started what later became the Indian Statistical Institute (ISI). A sparse group of young men kept him company, R C Bose, S B Sen, V G Pendharkar, B N Datar amongst them. As the years rolled on, ISI carved its own history, even as most of the young contingent went to their different destinations. S B Sen was still groping to discover his moorings. He had already a crowded, mixed-up past: a revolutionary and political activist, with two prison terms behind him and steadfast sojourn into Marxist faith. The science of statistics was young and the possibilities of its application in the country, once it extricated itself from colonial clutches, were immense. Existence as a detached academic was hardly reconcilable with Sen's persona though. Mahalanobis was however a charming authoritarian; he had, besides, an exciting parallel ideology to trap young dreamers into: statistics, applied statistics, don't you know, would transform the nation. Sen was, for a full decade, in and out of the ISI, alongside stints with the United Nations Statistical Sub-Commission and as UN staff member, part of the faculty assembled at Manila to train young statisticians for the fledgling administration in the Philippines, the archipelago declared to be independent only a while ago. The lure of lucre and international travel soon palled; other, stronger stirrings of praxis took charge of Sen's intinerary. The immediate task at that juncture was to assist Mahalanobis to develop the infrastructure of the grandiose National Sample Survey (NSS). The mystique of interpenetrating samples had not quite worn off, a spirit of adventure was abroad, admixed with patriotic ardour of an intense sort. A nation, on the threshold of embarking on co-ordinated social and economic planning, was in quest of basic data, basic data not just on consumption and

expenditure patterns, but on the structure of landholdings, on other types of assets at the disposal of humdrum households, on demographic, ethnic and linguistic profiles of people inhabiting the different regions of the country, and so on. The NSS has now been rendered into a bureaucratic commonplace. In that particular phase, it was both a beacon and a promise. Organising the NSS called for meticulous work. including design, stratification and testing of samples, \*locating and training the field staff, and analysing and interpreting the data and assessing their statistical significances. PC Mahalanobis was a drumbeater; perhaps planning needed drumbeaters of his stature at that moment. There was however an equal need of one or two quiet individuals wno would contribute to the spadework and knit the organisation together. As one of the principal functionaries in the ISI after Mahalanobis, S B Sen filled that crucial space. The NSS excited Jawaharlal Nehru no end, there were, for days on end, rapturous reports about its scope and potential in the newspapers. The latter had, reasonably enough, no occasion to mention Sen: he did not provide them with any opportunity to mention him. Sen and self-effacement fitted snugly into each other.

That was still a temporary situation, activism in the cause of the communist party was always the priority. The links with the ISI loosened in due course. Party work beckoned. Here too, Satya Brata Sen preferred the niche of the quiet corner to the limetight. The cause of the people was coterminous with the cause of the party; writing pamphlets and holding party classes were part of the daily drill, combined with forays into trade union work and on the peasant front as well. Soon, a succession of other responsibilities was loaded on him. He was summoned to be economic adviser to the first democratically elected communist regime in the country, the short-lived administration in Kerala headed by E M S Namboodiripad. That government was dismissed in no time, but Sen's agenda remained full. It was increasingly activities calling for the highest commitment, but his functioning was always from behind the demure curtains: chalking out the party's programmes and strategies, writing tracts and preparing educational material for the party's young cadres, drafting blueprints for effective land reforms, contributing his bit as a member of the editorial boards of party journals. The scientific approach to things and events was however never missing: analyse the data before you formulate your premises, and plan your action in the light of hypotheses that have firm roots in facts and logic. Sen would not hustle others, but he would not allow himself to be hustled either. And his politeness, even when dealing with ideological adversaries, was a legend.

The best was yet to be. Few people, whether inside or outside the movement, know even as late as today the details of the hard work that went into the creation of the edifice of the three-tier panchayat system in West Bengal, the resounding success of which largely explains the durability of the Left Front administration, without interruption, over the past two decades. It was, jubric by rubric, mostly S B Sen's

construction. As planning adviser and, subsequently, vice-chairman of the State Planning Board, he slaved away and produced the practical grammar for a vibrant grass roots democracy come to full bloom in rural West Bengal. A popular democratic revolution engulfing the entire land will have to wait; meanwhile, though within its limited contours, West Bengal has provided the illustration, how to mobilise and deploy people's power in the cause of the people themselves. Sen demonstrated for his party comrades how a simple proposition could fetch huge dividends: land reforms facilitated the acceleration of the pace of decentralised rural administration and, vice versa, you got even richer dividends if you decentralised the educational system and integrated it with the decentralised administrative framework.

There were other comrades around, but it was essentially Sen's miracle. Not that flaws and inadequacies have been weeded out wholesale; that is a somewhat improbable target to reach in a national milieu which reeks of both insensitivity and self-seeking. The outcome of S B Sen's theism would still appear to be winning the day, at least in some parts of the country.

Which is perhaps why the present Left Democratic Front administration in Kerala, soon after assumption of office, sought his advice on the mechanics of meaningful rural decentralisation it should lean on. He accepted the invitation with alacrity; the contents of the task were near-identical with what they were in the case of West Bengal, the cause of the people was invariant; the ambience was however different, and therein lay the challenge. That work-in-progress, alas, was left unfinished when it was time for him to go.

A generation ends with his going, a generation which believed that the focus of the nation's affairs deserves to be exclusively on expanding the welfare of the hundreds of millions of countrymen made up by the peasantry and the working classes; the rest of the agenda is dross. A scientific approach, besides, must also inform, in the view of the same generation, the analysis of problems and issues which affect the common people. These men and women equally firmly believed that insensate profit-seeking does not further, but actually ruins, the prospects of a nation. Sen, one of the earliest Indian entrants into any of the United Nations agencies, could have accumulated on a world scale and led a life of indolence and luxury; instead, he chose to be a humble functionary of the communist party, and he would not accept even the minimal wages the party could spare for a wholetimer. A rare man has gone gentle into the night.

# **Rural Credit: New Role for AFC**

H B Shivamaggi

The finance minister's proposal to set up state agricultural finance corporations provides an opportunity to revive the Agricultural Finance Corporation, an all-India public sector institution which has the necessary expertise, currently under-utilised, in rural sector consultancy for financial services.

SINCE the co-operative and commercial banks have their inherent limitations in rendering techno-financial assistance in a big way to the development of hi-tech exportoriented agricultural activities which have been expanding on an unprecedented scale in Karnataka, the state government felt the need for a separate state-level lending institution like the Karnataka Agricultural Finance Corporation (KAFC), on the lines of the Karnataka State Finance Corporation (KSFC) meant to look after the industrial sector, to give a further thrust to hi-tech agriculture. Accordingly, the state government availed of the consultancy services of Agricultural Finance Corporation (AFC) to advise it on the feasibility and viability of this proposal. The AFC has recommended the establishment of KADFC.

Now that the union finance minister has opted to establish such institutions in different states with NABARD as the chief promoter, this becomes an all-India programme. In this changed context, it is essential to remember that there are two public sector institutions at the apex level for agricultural finance - NABARD and AFC. We have to examine in what manner and to what extent this new work can be shared by these two institutions. It is in this regard that the role of AFC has to be re-examined and redefined.

# BACKGROUND

Established in 1968 following social control over banks, the main objective of AFC was to finance agricultural projects and to assist commercial banks to participate extensively in agricultural development. The objects of the corporation were defined comprehensively so that it could finance or help in financing all activities relating to agricultural production, marketing, transport and storage of farm produce, farm mechanisation, animal husbandry, activities relating to inputs for agriculture, forestry and all other activities connected with agriculture.

In the first year or two of its functioning, AFC had the dual role of directly financing agriculture and indirectly promoting agricultural credit operations of its member banks. However, the nationalisation of 14 major commercial banks in 1969 changed the whole situation. Direct financing of agriculture by AFC was short-lived because the banks started to build up their own organisational set-up to take up direct lending in the rural sector. Realising that the banks were no longer keen to finance agriculture

through AFC, the latter decided in 1971 that it would not normally undertake direct lending but instead would help the banks in their agricultural lending activities. This change in the role of AFC was spelt out by the then chairman of AFC, M L Dantwala, in his annual address to the shareholders in 1972:

Agricultural Finance Corporation is some what like a research and development wing servicing the commercial banks, rather than an independent financial institution. It seeks to do collectively for the member banks what each of them would have been required to do individually the AFC tries to explore and identify fresh avenues of financing agricultural development, test the technical and financial viability of new ventures, remove the procedural road blocks and legal hurdles, provide encouragement and assistance to new entrepreneurs, acquaint the bank personnel with complexities of new proposals and even make its services available to the member banks to supervise implementation and check performance. The approach and the technical expertise which an organisation like this builds up is somewhat different from the one required by an apex financial institution.

# FROM FINANCE TO CONSULTANCY

This change in perception meant that AFC henceforward would specialise in (1) surveying potential for agricultural project lending in different parts of India, (2) formulation of viable schemes for ready use of the banks, (3) bringing newly identified rural sector entrepreneurs in touch with banks, (4) undertaking monitoring of schemes, and (5) performance evaluation of completed schemes.

Many doubts and questions did arise in this respect. Was it a tall order for AFC and beyond its organisational and expertise capabilities? Would AFC be able to obtain and retain expert staff required for the multipronged job? Would member banks agree to draw a line as to how far they will build up their own rural credit set-up and encourage AFC to build up expertise as envisaged? How far would NABARD encourage and promote such institutional development?

Subsequent events belied most of the hopes of Dantwala and brought AFC to the crossroads once again. The end-users of services of AFC are ultimately the banks and NABARD. While AFC has shown commendable initiative and zeal for expending and diversifying its activities as can be seen from the data given below, banks and NABARD have tended to become self-

reliant in all their project work. Since they are now less interested in AFC, the latter has reached a dead end. The recent developments need to be reviewed in this changing context.

Since its establishment in 1968, AFC has handled over a thousand multi-disciplinary assignments. A look at the list of recent assignments given below brings out the diverse nature of its consultancy work both in India and abroad which has surpassed all expectations.

Agro-industries (8)

Area development (12)
Bio-technology (1)
Command area development (7)
Dryland agriculture (1)
Fishery (2)
Forestry and wastelands (2)
Hi-tech agriculture (10)
Horticulture and plantations (6)
Irrigation (4)
Livestock, diary, poultry (3)
Market development (3)
Monitoring and evaluation (10)
Rural credit (7)
Others (4)

Rehabilitation (5)

Besides providing services to government bodies, AFC has recently completed assignments for private corporations and voluntary organisations. As regards foreign consultancy work, AFC has done work in nearly 25 countries. The information available from the annual report for the year 1994-95 broadly indicates that out of about 129 domestic assignments completed or on hand. eight were from NABARD whereas only five schemes were from banks. The rest of them were mainly from the government sector. This implies that barring five banks including three co-op banks which have availed of AFC services to some extent, other banks have remained away from AFC though nine among them are on the board of AFC and in that sense are involved in building up AFC. To goad banks and NABARD to make greater use of the services of AFC. a meeting of a senior-level operational coordination committee was called in AFC in 1989-90 with a view to tinding out what type of assignments NABARD and banks could give to AFC Each member bank was expected to identify the projects/studies which could be taken up by AFC in the next

It appears that while the concerned bodies do not feel the necessity of approaching AFC for specific work, AFC is keen to get work from them to justify its existence and to remain viable. This struggle to get assignments for justifying its existence is not healthy. Instead of the present ad hoc role of AFC, its role vis-a-vis NABARD and banks should be redefined so that it can plan its work on a long-term basis. In the present context of increasing work-load at the apex level, this is an appropriate time to re-examine the role of AFC.

As stated above, the diversification of AFC's activities has surpassed all expectations. In the earlier period, besides land

development, irrigation and other agri-based schemes, it also handled schemes such as forest development, infrastructure development, rural industries, gobar gas plants, financing flood and cyclone affected areas. More recently, it has taken up hi-tech agricultural projects, bio-techonology, wasteland development, integrated district credit plans, etc. AFC has also taken up many international assignments. It goes to the credit of AFC that faced as it was with decreasing demand for its services, it continued to maintain its consultancy role by its readiness to go to difficult areas and accept difficult projects both in India and abroad. Though all this is commendable, the question arises: what is the role for AFC in the long run?

Expressing this worry, the Annual Report for 1994-95 says, "the corporation has earned a profit of Rs 6.72 lakh for the year 1994-95 as against Rs 58 lakh for the year 1993-94. The fall in profits during the year was mainly on account of the decline in business from the government sector...". While the number of new consultancy assignments (19 in 1992-93, 11 in 1993-94 and 15 in 1994-95) is not going up as much as is desired, overall earning from this work is not able to take care of increasing salary and other overhead expenses as can be seen from the approximate data given below:

(Rv crove)

|                         | 1992-93 | 1993-94 | 1994-95 |
|-------------------------|---------|---------|---------|
| Total income from       |         |         |         |
| consultancy             | 5 63    | 6.83    | 6 01    |
| Total expenses of which | 6 48    | 7.68    | 7 33    |
| (i) Project expenses    | 3.95    | 4.93    | 4.38    |
| (ii) Salaries, etc      | 1.56    | 170     | 1 88    |
| (iii) Other overheads   | 0 97    | 1 05    | 1.07    |

Note: Figures are rounded off

It appears that but mainly for the interest income, AFC finds it difficult to remain viable purely on the basis of consultancy earnings. Some of its branches like those in Bhubaneshwar, Ahmedabad, Trivandrum and Calcutta spend much more than they earn primarily because neither the state governments nor the banks with dominant presence in these states show interest in availing of services of AFC. It is surprising that the directors' annual reports of AFC do not give adequate attention to this upcoming predicament.

# CRAFICARD'S VIEW

It is important to remember that earlier in 197!, the National Commission on Agriculture in its interim report on 'Credit Services for Small and Marginal Farmers and Agricultural Labourers' had held the view that

it might be ultimately necessary to set up an ADBI on the lines of the IDBI to consolidate the expertise and experience of various agencies such as the ACD of RBI, the ARC and the AFC into a single national organisation.

In 1972, the Banking Commission also pleaded for the merger of ARC and AFC into one new institution. This new institution "will be in a better position to help promote development financing to a much greater extent by both co-operative and commercial banks".

Craficard which was appointed in 1979 to review the working of rural credit system in India was specifically asked "to study the consultancy services provided by the AFC," and suggest improvements for achieving satisfactory co-ordination between it and financing institutions". After examining the various viewpoints, the committee stressed the need for AFC to remain as an independent all-India body. To quote its words,

Taking into account the nature and magnitude of rural development work in which banks have to play a catalytic role and keeping in mind the efforts needed to nurturing and bringing up a rural development consultancy organisation, our view is that not only is there need for an independent all-India body like AFC but also for regional or specialised consultancy bodies to cater to specific problems of specific areas.

Subscription Rates:

Annual: Rs. 100.00

Single Issue: Rs. 10.00

Foreign: \$ 20.00

Apart from an expanded role of AFC through its services to government and development organisations, Craficard has stressed the need for linkage between AFC and NABARD. This is expected to ensure that the work undertaken by the AFC is by and large acceptable to the latter. Unless such a link is forged, AFC's efforts may not yield the maximum benefits. For this purpose, Craficard suggested as follows:

NABARD should lay down (i) the basic criteria for programmes that have been developed widely so far and (ii) in new cases, fix in advance, after discussion with the AFC, the criteria that will satisfy them.

NABARD was also expected to assign to the AFC jobs in areas covered by RRBs who on their own cannot afford to employ AFC. Besides, NABARD was also expected to utilise AFC for developing innovative projects. Craficard also emphasised the need to redefine the specific role which AFC has to play in respect of certain areas and for certain purposes, and particularly in pockets of poverty. AFC has also to help the cooperative sector. All this as envisaged has not materialised.

#### STAFF MOTIVATION

A consultancy organisation like AFC faces a dilemma in regard to staff. Though its diversified assignments required innovative approaches and experts in different fields, it will not be feasible to keep all the expertise required as regular staff. It has therefore to depend on outside consultants. While this arrangement works out satisfactorily insofar as work is concerned, the regular staff tends to get disenchanted in the absence of adequate number of officers to carry out the work efficiently and because of lack of promotion avenues on the lines found in sister institutions like NABARD and banks. There are only about 72 officers as against a sanctioned strength of 222. Another aspect to be kept in mind is that mobility of staff is important for better motivation of staff to shoulder the varied assignments entrusted to AFC. This is an issue which needs urgent attention. One practical solution lies in making AFC part of a bigger set-up without compromising on its independent status so that staff development becomes more flexible.

#### BIGGER ROLE FOR AFC

Crafficard, after emphasising that the linkage between AFC and NABARD is important for the maximum use of AFC, did not provide for any built-in link but only hoped that things will work out as desired. However, the position at present is that even the chairmen of banks who are on the board of directors of AFC have not availed of AFC's services for their own banks. AFC has to go from door to door to canvass for its business. While there is no doubt that AFC has pursued vigorously its efforts in expanding and diversifying its activities, much of what Craficard envisaged as a part of the future role of AFC has not materialised particularly in its relationship with NABARD, Whereas some banks give some work if only to oblige AFC, NABARD, on the other hand, has not shown much interest in AFC. But for the efforts of AFC itself to canvass for work and willingness of the government of India and state governments to avail of AFC's services, this organisation would have stagnated. In the circumstances, AFC is not able to plan its work on a longterm basis. The choice now therefore is either to allow AFC to drift as at present or to link it effectively with NABARD so that not only will banks no longer be reluctant to avail of AFC services but also NABARD itself will have the obagation to ensure maximum use of AFC. This kind of link can be operationally meaningful only if AFC is made a subsidiary of NABARD. The specific advantage of this arrangement is that AFC continues to be an autonomous entity but it will also be assured of a steady flow of work. Further, NABARD can have a regular flow of innovative projects covering complex purposes and backward areas. In this connection, a suggestion may be made. As it is with large-scale lending and refinancing work, the proposal to take up direct lending and inspection of co-operative banks. NABARD is already overburdened with work. It is hence appropriate to raise the question whether the additional work of launching state-level Agricultural Finance Corporation can be entrusted to AFC which is also a public sector apex institution, under the overall guidance of NABARD. AFC has all the expertise and experience to shoulder such responsibility and even at this point of time it has the ability to complete this work as a time-bound programme. The financial arrangement for this purpose and for converting AFC into a subsidiary of NABARD is an administrative issue and can be worked out between NABARD, AFC and the 37 banks who presently are shareholders in AFC under the overall guidance of government of India and the Reserve Bank.

The broad changes may be as below:
(1) After AFC becomes a subsidiary of NABARD, there has to be a common board of directors for NABARD and AFC.
(2) The present board of NABARD has to

be reconstituted keeping in mind the fact that AFC is now a NABARD-subsidiary and this board will be common to both apex bodies.

(3) The managing directors of NABARD and AFC will be on the common board.

(4) The board may constitute a sub-commuttee of its own to oversee the sharing and co-

ordination of work between NABARD and AFC on the one hand and between AFC and banks on the other so that duplication of efforts noticed at present is avoided and the role of AFC vis-a-vi: NABARD and banks is properly spelt out.

(5) It is logical to transfer the evaluation and monitoring department of NABARD to AFC.
(6) The staff of AFC will be fully absorbed in NABARD in due course so that complete mobility of staff and entry of new blood in AFC on a continuing basis are taken care of Under this arrangement the career prospects and motivation of AFC staff will improve.

By way of conclusion, it needs to be emphasised that AFC, an all-India public sector institution, which has built up expertise and an international reputation in rural sector consultancy for financial services, should not be allowed to function in an uncertain and ad hoc manner and should be fitted into the whole institutional system for lending for agricultural and rural development. Now is the opportunity and it should not be missed by GOI, RBI, NABARD and AFC itself. The extra work of launching new agricultural institutions at the state level should be shared by NABARD and AFC. Through this measure, not only will NABARD not be over-burdened but AFC's services will be fully utilised.

**POWER** 

# **Expanding Systems, Poor Management**

S N Roy

Changes in the pattern of demand and weak distribution systems are contributing to increasing transmission and distribution losses. A decreasing proportion of bulk and high tension users and financial constraints which reduce system losses, and financial stringency which have forced state electricity boards to extend provide poor service and extend the system without adequate services are the two main factors.

THE transmission and distribution (T and D) losses in India, at about 21 per cent, has remained a subject of debate for the last several years. There is no doubt that these losses are quite high when compared to only 5-8 per cent losses in developed countries What should be the reasonable level of T and D losses in a vast country like India and the scope to bring down these losses is a matter which has been deliberated upon at length by Rajadhyaksha Committee constituted by the government of India in 1978. This committee recommended that T and D loss should not exceed 15 per cent, keeping in view the vast network of distribution system in rural electrification and multiple transformations. The committee also recommended the strengthening and augmentation of the transmission and distribution systems to bring down the losses and adopting counter measures against pilferage and theft of electricity.

The T and D losses have reportedly declined from 23-28 per cent to 21-8 per cent during the last five years. But analysis indicates that SEBs are making talse claims and in fact the losses are rapidly increasing as they have failed to strengthen and augment the sub-transmission and distribution system adequately to cope with the increasing availability of power.

The growth rate of power has been quite high in the recent past and as the area to be served is large stress has been given to achieve the maximum with the limited resources, it has resulted in a weak T and D network with an overloaded system involving longer lengths of distribution lines. Apart from the high technical losses, the energy theft in distribution system covering even industries is a cause of great concern.

2793

Transmission losses hardly contribute to less than 20 per cent of the total losses which means that 80 per cent of the losses are in the distribution mains. It has been felt that accurate estimation of unmetered supply may reveal quite a good percentage of theft. Utilities abroad have the T and D losses within about 8 per cent. The scenario in India however cannot and should not be compared with those prevalent in Europe and America. Their loss figures are not due to pilferage and theft and have been contained to a low figure due to strongly meshed network.

The T and D losses were contained at a level of about 15 per cent till the end of Third Five-Year Plan. The percentage losses during the Fifth Five-Year Plan increased from 15 per cent to 18 per cent when a massive rural electrification programme was undertaken. From the Fifth Plan onwards the T and D losses has been varying between 20 to 23 per cent. This is the period when a substantial percentage of the T and D losses and pilferage of electricity have been transferred and shown as agricultural consumption to hide excessive T and D loss and heavy pilferage.

The changes in the pattern of demand and extremely weak distribution system have contributed to the ever increasing T and Dlosses in this country. It is well known that the bulk and HT consumers reduce the losses as no LT lines are involved for power supply to them. The percentage of HT connections however is gradually declining and in a short time frame of 1979-93 its consumption has declined from 52 per cent to 32 per cent and is continuing to decline at a faster rate. The connected load of HT consumers has also declined from 25 per cent to 18 per cent in the same period. Most of the bulk consumers are setting up their own captive power plants due to uncertainties of grid power and therefore their percentage in the total demand will further go down,

The allocation to T and D during the last 15 years is merely 30 per cent against the standard norm of 50 per cent of the total plan outlay. Due to inadequate allocation, the SEBs have been forced to extend the distribution system in most of the cases to provide new connections. The length of the distribution system has therefore abnormally increased from 9.4 lakh circuit km in 1970-71 to 43.00 lakh circuit km in 1992-93, giving a five-fold increase. On the other hand the increase in sub-transmission system comprising of 132 and 33 KV lines to provide new step down sub-stations has only doubled. The longer length in the distribution system has not only resulted in overloading and poor voltage supply to consumers but has immensely added to losses. The distribution system in our country involves 100 km of LT lines for each MW of demand which is four to five times higher as compared to Japan, where the losses have been contained at only 5.8 per cent. This is the main technical reason of high T and D losses.

The SEBs have neither suitably augmented the distribution system nor changed their policy to provide more HT connections leading to considerable increase in the losses. In order to hide their inefficiencies they have resorted to large-scale manipulations of agricultural consumption to transfer the excessive T and D losses as also pilferage to agricultural consumption where the energy is not metered but only estimated. The agricultural sector happens to be a politically sensitive area and therefore, the policy-makers have preferred to keep mum on the large inflated consumption in agriculture and thus SEBs have been saved from criticism for their inefficient working. Not only that, the boards are strangely putting claims for large subsidies to the state government for

the excessive T and D losses and pilferage of electricity. The claims on this account exceed Rs 5,000 crore per year.

The extent of manipulation in the agricultural consumption can be gauged from

the following analysis:

(i) The agricultural consumption per KW of the connected load has increased from 755 units in 1970-71 to 1,846 units in 1993-94 and at its present high growth rate of over 12 per cent, it may even exceed 2,400 units in 1996-97. This gives a three-fold increase in agriculture consumption, although the duration of supply is gradually reducing due to shortage of power. During the period

| All India      | 3,24,050            | 2,38,670       | 70,700       | 1,67,970 | 51.84                                                  |

1971-94, the average consumption per KW of all sectors have remained constant at about 1,500 units. The manipulations are so large that the agricultural consumption per KW may even overtake HT consumption during the next year.

(ii) In the first three years of the current plan, about five lakhs pumping sets per year have been energised which should give a growth rate of only 5.5 per cent on a base of 9.2 million pumping sets at the commencement of the plan. The actual growth rate however is about 12 per cent, i.e., more that, double the projected growth. It establishes therefore, that 50 per cent of the energy growth accounts for excessive T and D loss and pilferage of electricity for which there does not appear to be any logical explanation.

The Planning Commission in the Eighth Plan document has set a growth rate of 7.28 per cent and a ceiling of agricultural consumption at 76 billion units in 1996-97. It may be interesting to note that this ceiling has already been exceeded in the first three years when the agricultural consumption has reached about 80 billion units. The power planners therefore, should deliberate on this massive manipulation of agricultural consumption to find out a viable solution to tackle this malady. In view of the unmetered supply to the agricultural sector and other social electrification programmes in many states, the extent of accuracy of the T and D loss figures are not predictable and their authenticity could be questioned.

In order to evaluate the percentage of excessive T and D losses and pilferage we may consider the actual figures of consumption in Tamil Nadu, where the energy is mostly metered. In their case the average consumption per KW in 1992-93 was only 1,129 units. This is very close to the manipulated consumption figures of 1,212 units for the country during 1986-87. It appears reasonable to put the agricultural consumption at an even higher level of 1,200 units per KW compared to 755 units in 1970-71. The consumption in 1996-97 may exceed 2,400 units per KW or over 40 per cent of the total energy sales of the SEBs. The actual consumption during 1992-93 stood at 33 per cent and will certainly exceed 40 per cent during the terminal year of the plan. It thus implies, that 50 per cent of the energy in the agricultural sector is merely overestimated to hide excessive T and D losses and pilferage. As the consumption for agriculture may exceed 40 per cent during 1996-97, on a conservative basis, 50 per cent of this consumption or 20 per cent of the total energy sales reflect the overestimates made by the SEBs. At least half of the inflated energy may account for excessive T and D losses and the balance towards pilferage. Thus, the actual T and D loss may exceed 32 per cent as against 22 per cent being reported by the SEBs.

The government had introduced incentive schemes and awards for reduction of T and D losses. Instead of introducing technical remedies for high T and D losses, it becomes easier for the SEBs to carry out greater manipulations to win the awards. The guidelines of using modern computer aided technique for planning, design and control of distribution systems have merely remained on paper and cannot be made effective unless the root causes are tackled with a firm hand.

T and D losses and consumption in agricultural sector exceed 60 per cent of the

energy sales in the states of Haryana, Punjab, UP, Gujarat. AP and Karnataka and other states are fast approaching this figure. At the present growth rate of 12 per cent in agriculture the above percentage is likely to go up. Certainly the SEBs cannot manage their affairs by earning revenues only from 40 per cent of the energy generated and as such they are on the way to bankruptcy in the Ninth Plan (refer table).

The high system losses are neutralising growth. To bring down the losses would mean a massive drive to plug the leakages improve and refurbish the distribution system through sufficient investment and the adoption of state-of-the-art techniques in optimising the distribution system, shunt compensation and proper metering to establish energy accounting.

The country is witnessing a sharp increase in domestic demand due to change in lifestyles and the addition of a large number of new connections. This trend may continue for the next 2/3 decades as so far only about 40 per cent of the population is deriving the benefits of electricity. The evening peak demand on the system is thus rising fast. An analysis carried out indicates that the peak time losses are about 50 per cent higher than the average T and D losses since the entire LT distribution system comes into operation for meeting domestic demands. On this basis the peak time T and D losses are estimated at 48 per cent which means that the country requires a large installed capacity to meet the peak demands.

The high level of pilterage of electricity and excessive T and D losses are of great concern to policy-makers and unless the pilferage is curbed and T and D losses controlled, all the SEBs may be headed for a financial disaster.

# **Quebec Separatism**

# October Referendum and Beyond

Sudha Pai

Since the 1960s Quebec has experienced the most powerful separatist movement in the west. The referendum held in October 1995 failed to garner a majority of votes for sovereignty, but the campaigns have led to a hardening of attitudes between Francophones and Anglophones.

QUEBEC has experienced since the 1960s the most powerful separatist movement in the west, followed probably by Flemist nationalism in Belgium. In the early 1980s it was considered 'dead', but following the failure of the Meech Lake and Charlottetown Accords in the late 1980s, there has been a dramatic resurgence of francophone separatist nationalism. This has been particularly marked since the victory of the separatist Parti Quebecois (PQ) in the provincial elections of 1994.

In the referendum on sovereignty held on October 31, 1995 by the ruling PQ which attracted worldwide attention, Quebeckers were asked to vote 'yes' or 'no' on the referendum question put before them by the Quebec government. There was a record turnout of over 90 per cent, and out of a total of 4,756,229 voters who cast votes, 48.5 per cent voted yes while 49.7 per cent voted against leaving Canada in order to form a separate country. More than 87,000 spoiled ballots - 2 per cent of the votes cast - may have made the difference because they accounted for many more votes than the spread between the yes and no votes ('No by a Whisker', Globe and Mail (G and M), October 31, 1995). The Parti Quebecois which has been the main separatist party in Quebec since its formation by the late Rene Levesque in 1968 - failed to convince a majority of Quebeckers that their future lay in leaving Canada to form a separate country under its aegis. This is because since its inception the party has oscillated uneasily between supporting the secessionist cause and providing 'good government', and also between the idea of total separation from Canada or sovereignty-association with it. Even today it suffers from internal factions, divided leadership and lack of clarity of ideology and goals, and therefore the inability to convey a clear message to the public in the recent referendum. Corresponding to this has been the uncertain position adopted by Quebeckers on the subject. Studies show that in the 1970s and 1980s, a group of between 7 to 10 per cent of Francophones voted for the PQ while having serious doubts about independence (G and M. September 13, 1995). Many of them today remain unsatisfied with confederation as it exists

and Quebec's position within it, but are not sure if they want the separatist alternative offered by the PQ. Thus in periods of constitutional crisis, nationalist feelings and support for sovereignty run high, but when the same is linked to a clear vote for imminent secession then there is a sharp drop. These problems – of doubt, uncertainty and lack of clarity about the future – have been faced by separatist movements everywhere, Yugoslavia providing a good example.

Many of these problems were visible in the October referendum, and underlie the defeat of the sovereignists led by the PQ: (1) The term sovereignty was never clearly defined and its meaning and implication shifted during the campaign from total separation to the 'softer' option of sovereignty-association. While Parizeau and his supporters in the PO felt that separation was necessary, his allies - the Bloc Quebecois (BQ) and the Action Democratique (ADQ) - supported the idea of association. Hence the new separatist alliance formed before the referendum lacked a clear platform and failed to hold together in a convincing manner. (2) The separatist parties were also divided over the tactics to be adopted. As a consequence, the 'yes' side had to work very hard in order to gain even 48.5 per cent of the popular vote, and reaching 50 per cent did not seem feasible at any point during the campaign. Except for a short period in mid-October, the support for the 'yes' side remained low. (3) The referendum question itself was not very clear, and the general public's understanding of it remained confused. These factors are elaborated in the description of the referendum campaign given below.

# RUN UP TO REFERENDUM

In the 1994 provincial elections – held just a little over a year before the referendum – the PQ had performed well, getting 77 seats and 46.8 per cent of the vote, its second best score since its formation ('The Quebec General Elections', September 12, 1994', Regional and Federal Studies, Vol 5, No 1, Spring 1995, pp 94-102). However, it failed to cross the important psychological barrier of 50 per cent, which was due to the general perception that since the leadership was in the hands of the separatist faction under

• Jacques Parizeau, a victory for the PQ would lead to either a Unilateral Declaration of Independence (UDI) or a referendum. Hence the results were an indication that while Quebeckers were prepared to accept the PQ as a ruling party because of its earlier record in the 1970s and 1980s, a majority were not prepared for separation. It also became clear that the PLQ had more support than had been expected, the sovereignty referendum would witness a tough fight, and the PQ could not expect an easy victory.

Once in power, the PO leadership declared that unlike in 1980, the referendum would be held within the next 10 months. In February 1995, the PQ began public hearings by a national commission on the question of independence. By this it hoped to build up emotional support for the issue and to form ideas for the referendum question. Spread over four weeks in February and March 1995, it was a vast exercise undertaken by 17 regional sub-commissions, made up of important public figures, which visited all parts of the province and held a total of 304 sessions in 223 communities, at an enormous cost. Contrary to the expectations of the PQ and especially Parizeau, media reports show that except in areas of staunch PQ support, the commissions did not turn out to be platforms for spreading the separatist message, nor was there any groundswell or support for the cause. Outside Montreal and Quebec city, where most of the Francophone clite reside, in smaller towns, especially in the 'Bois France' area where many 'soft' nationalists live, the commission made little headway (Macleans, February 20, 1995). The findings of the commission led Parizeau to postpone the referendum to the last part of the year, and were also instrumental in the PO moving closer to the BO, and as explained below, the latter's more soft definition of sovereignty.

The PQ and the BQ at the federal level under Luchien Bouchard merged their organisations in September 1994 after the provincial elections, in order to fight the referendum together against the 'federalists' led by the provincial liberals (PLO) under the leadership of Daniel Johnson, who had the support of the prime minister, Jean Chretien. Three documents on sovereignty were tabled in the national assembly of Quebec by Parizeau in 1995 prior to the referendum, which show a dilution in the meaning of sovereignty from that of total separation during the 1994 campaign, to economic association with Canada. The first was the partnership agreement (PA) of June 12, signed between the PQ, BQ and the newly formed ADQ, to fight the referendum together and execute thereafter jointly a two-fold 'common project' which would enable Ouebeckers to become 'masters in their own house'. Following a victory in the

relevelled the transported brocketti the sovereignty of Quebec and would be bound to propose to Canada a treaty on a new economic and political partnership so as to "consolidate the existing economic space" (text printed in G and M, October 31, 1995). Under it Quebec would keep the Canadian dollar, assets would be divided, there would be common management of the debt, mutual trade agreements, a customs union, free movement of goods, services and capital would be allowed, a common monetary policy and citizenship. It also provided for joint political institutions to settle differences. In fact the document proposes a movement towards a loose confederal arrangement rather than a new nation-state. Its real role was to convince Quebeckers that they could have 'independence without tears' and thereby win over the 'soft nationalists' Opinion polls by CROP since the 1994 elections had consistently shown that a promise of a partnership would help the 'yes' side.

The second document was the proposed text of Quebec's declaration of sovereignty released on September 6. Compared to the PA which states the official position of the PO and its allies, it is an emotional document which refers to historical memories of the conquest, English domination, the need to preserve the 'distinct' Francophone identity, a common glorious future, and calls upon the people to "reap the fields of history". Based upon the notion of communitarian rights on which Francophone intellectuals and leaders have always based their arguments, the declaration nowhere uses the term Quebecker and obviously held little appeal for Anglophones, Allophones or first nations people. Under it, 'others' who have made Quebec their home are invited to share in this project and guaranteed equality, justice and democracy (printed in G and M, September 7, 1995). The third document was the referendum question described later.

# REFERENDUM CAMPAIGN

Although the campaign began officially on October 2, 1995, in fact the issue of sovereignty had been inscussed extensively during the 1994 elections, and particularly from June 1995 onwards. Various opinion polls widely reported in the media allow us to trace opinion formation and the swings in thinking on the part of the public. Apart from a very brief period in early September, and again early October, up to almost mid-October the 'no' side had a clear lead (G and M, October 31, 1994). A CBC poll showed on October 6, that 55 per cent were against while 45 per cent were for sovereignty, though 13 per cent remained undecided and 20 per cent admitted when pressed that they might change their minds prior to the polls (G and M, October 6, 1994). The poll analysis suggested in early October that the sovereignist side had not gained ground since the formal launch of the referendum campaign.

The appointment of Lucien Bouchard by the sovereignist side as the chief negotiator and leader of the campaign, in the first week of October, to counter this trend introduced a slight upward surge which took the sovereignist side to 49.2 per cent and the opposition to 50.8 per cent (Leger and Leger Poll, October 8-14, 1995, reported in G and M. October 19, 1994). In fact, by October 19 the two were neck to neck and it did look for the first time like the 'yes' side would surge ahead and win. The 'no' side continued to experience a downward slide, and the 19th a Leger, Journal de Montreal, and G and M joint poll put the 'yes' side at 50.2 per cent and the 'no' at 49.8 per cent. There was also a clear division between the Francophone and non-Francophone vote, the former supporting sovereignty and the latter being firmly opposed to it (G and M, October 21, 1995).

However, by October 27, the boost received by the sovereignist side from a highly charged emotional campaign by Bouchard came to a halt without gathering enough momentum to carry them to a final victory. The last three polls conducted between October 25 and 27 show a peak before a downward slide (G and M, October 27, 1995). In retrospect an analysis of the various polls conducted after the referendum shows that public opinion in Quebec was not as volatile as the emotional upheaval during the campaign may suggest. The ebb and flow of support for the two sides, over the seven weeks during which most of the polls were undertaken, rarely varied much more than the margin of error for most of the polls - which was plus or minus 3 points. The pattern thus was a slow start for the yes, a surge forward by this side forming a peak in mid-October which continued up to almost the end of October, and then a downward plunge. The level of undecided and refusals did not change in the CROP poll, for example, for the whole period. Thus if one ignores the anecdotal evidence and looks at only the raw data, the two sides could have been tied for the whole period. No side was able to command at any point 50 per cent of the support in the raw figures. Both sides used populist methods throughout the campaign, which was dominated by two issues. The first was the emphasis by the PQ on emotional and social issues, while the opposite side tried to highlight the economic issues involved in separation. The PQ leaders, including Bouchard, were convinced that unless Quebeckers were persuaded to see the referendum as the culmination of more than 30 years of nationalist struggle, they had no chance of winning.1 Hence they ran a highly charged emotional campaign which harped upon the themes of conquest, language, cultural domination, failure of Meech and other constitutional reforms, and argued that both the federal authorities and the provincial liberals had 'no alternative' to offer.

The second and more central issue was the meaning of the term 'sovereignty', about which there was considerable ambiguity duirng the campaign. The hardliners' faction in the PO under Jacques Parizeau had in the early 1990s, and particularly during the 1994 elections, emphasised sovereignty as complete independence; in fact this had long been the point of difference between them and Levesque. As a result, in the initial phase of the campaign the idea of economic association with Canada was not emphasised. However the poor response by electors visible in opinion polls and the low attendance at PO meetings necessitated a shift in strategy. The 'yes' side decided to bring in Lucien Bouchard - who had always stressed that sovereignty meant economic and political partnership and association with Canada on the lines of the Maastricht treaty - and the idea of complete separation was played down during the rest of the campaign. In a bid to increase support Parizeau also announced on October 6 a five-member committee of prominent Quebeckers, including important businessmen and entrepreneurs, who would carry out the negotiations on behalf of Quebec after the successful referendum. He argued that a 'yes' vote and pressure from the international community would force Canada to negotiate. Empowered by sovereignty Quebec would move on to a partnership agreement, but partnership, he pointed out, was not a condition for gaining sovereignty (G and M, October 13, 1995). However, even this stand was tempered by Bouchard who insisted that before proclaiming sovereignty, Parizeau would have to fulfil his legal obligation to negotiate a partnership deal. In fact it almost appeared as if the mandate being asked for was to merely begin negotiations with the federalists. The surge in support for the 'yes' side did lead to a hardening of the position of the PQ. Parizeau declared that if the federalist refused to negotiate the debt and other problems within weeks of a victory, or if negotiations broke down, Quebec would declare sovereignty (G and M, October 21, 1995).

These shifts on the part of the sovereignists created considerable confusion in the minds of the public. Polls show that a number of those planning to vote 'yes' believed that even after independence was achieved, they would send deputies to Ottawa, maintain economic ties with Canada, enjoy dual citizenship, use the Canadan dollar and passport, etc. Ambiguity over the meaning of the vote thus became part of the referendum campaign, and was in fact a tactic used by the 'yes' side to win over reluctant voters.

This ambiguity is reflected in the

referendum question.<sup>2</sup> It was long with 43 words, leaving much room for vagueness. It did not mention the word 'country' and chose the softer euphemism 'sovereignty' rather than separation.3 It offered the voters first a separation from Canada and then negotiations for political and economic partnership, which leads one to question the intentions of its drafters. The question thus was a convoluted paragraph meant to appeal to voters who remained unsure about what independence meant. As Johnson said, "It certainly gives the impression that sovereignty and separation are conditional upon the attainment of some new order, a new partnership, a new association, and a union with Canada as a foreign country, when in effect it does not" (G and M, October 10, 1995).

An analysis of the federalists' campaign shows that in the first few weeks they seized the initiative and were united, aggressive, and over-confident. Led by the PM and the PLQ, they tried to bring hard economic issues into the forefront of the debate: the debt, the deficit which could rise to \$15 billion, cuts in welfare, loss of equalisation payments, jobs, citizenship, and the high costs of separation. Second, they warned that sovereignty meant total separation and no negotiations would be held on any issue (G and M, October 9, 1995). These issues played an important role in early October and underlie the upsurge for the 'no' side, as polls show that a large number of those who intended to vote 'yes' were unclear on its implications. They were also aware that Ouebec had a fiscal deficit which it would have to deal with alone after independence. However, after October 15, when the 'yes' side began to gain, a conciliatory tone was adopted, and after the 20th panic even led to promises of giving more powers to Ouebec within the federation.4 The rising support for the 'yes' side exposed the differences within the federalist camp, which the sovereignists underlined to their advantage. For example, on October 21, the PM dismissed a suggestion from Johnson that Quebec be recognised as a 'distinct society' (G and M, October 23, 1995).

A number of factors helped the federalists. The Allophones, who constitute about 18 per cent in Quebec, largely voted against separation. There had been a backlash against them after the 1980 referendum, but they did cast their votes. A second factor was the psychological impact of an exodus by investors from Quebec - particularly from Montreal and Hull. A large number of people also shifted their savings or bought foreign stocks and bonds (G and M, October 26, 1996). The mood in the rest of Canada (ROC) too was not inclined favourably towards the sovereignist side, just as during the Meech lake and Charlottetown period. Many surveys showed that the ROC had little interest or patience with Quebec. For example, 33 per cent in Alberta believed that Canada would be better off without Quebec, and 88 per cent felt that a sovereign Quebec should not be allowed to use Canadian currency (G and M, September 8, 1995). Political elites in western Canada too were in a confrontational mood with the rise of the Reform party, and felt that negotiation and compromise with Quebec was now difficult if not impossible.5 Another factor was the stand taken by the native peoples in the northern part of the province. The Inuit and the Cree held a referendum of their own - the former on October 26, 1994 and the latter just days before the October referendum - and a majority voted to stay with Canada. In fact the Cree held that they would form their own state, which would mean a partition of Quebec. These factors prevented many Quebeckers - Francophones and others - from voting for sovereignty as they were apprehensive that independence would introduce insurmountable problems and that negotiations for economic association would be opposed by the rest of Canada.

#### CONCLUSION

Where does Canada go from here? The implications of the failure of the referendum may be briefly summed up. In the 1990s, and more particularly following the failure of the referendum, there has been a hardening of attitudes between Francophones and Anglophones in Quebec. The prolonged referendum campaign, which stressed divisive issues, also contributed to this. In the 1970s and 1980s, Anglophones in Quebec accommodated and in some cases were supportive of the demand for recognition as a 'distinct society', but this has been replaced by a strong anti-independence stand. The partition of Ouebec, a subject rarely discussed earlier, is now done so openly, and the referendum led to a large-scale exodus of Anglophones and Allophones from Quebec. Corresponding to this, many Francophones no longer subscribe to the concept of a 'plural society' in Quebec and moderate nationalism, but expect integration of non-Francophones in an independent Quebec.<sup>7</sup> Moreover, the 'middle ground', which was once crowded territory both in Canada and Quebec, is now very thinly populated and occupied mainly by intellectuals (Canada Reclaiming the Middle Ground edited by D GLenihan, Gordon Robertson, Roger Tasse, IRPP, 1994). Earlier much more room existed for bargaining, negotiations, and compromise; this has been replaced by distrust and lack of accommodation, which is not conducive to the functioning of a federal state. The ROC is no longer interested in the 'Quebec problem', something which is reflected even in academic writings on the subject (English Canada Speaks Out edited by J L Granatstein, Doubleday Publishers, 1991).

• The failure of the referendum left the separatist parties in disarray, although both Parizeau and Bouchard immediately said they would definitely try again. Leaders on both sides have stressed the need for change and reconciliation. In the first week of November, Parizeau resigned as premier and was replaced by Bouchard who is perceived as being easier to negotiate with. The PM Jean Chretien in December placed three proposals before Quebec: a parliamentary motion to recognise Quebec as a 'distinct society'; a bill that would give Quebec a veto on constitutional change; and a promise that the federal government will get out of manpower training, something Ouebeckers feel strongly about. The proposals have been rejected by Ouebec as coming too late and giving too little. Thus the situation seems to have reached an impasse and no easy solution is in sight.

## **Notes**

[The data for this paper were collected during a visit to Canada in May/June 1996 on a Faculty Research Fellowship from the Shastri Indo-Canadian Institute, Calgary, Canada, and is part of a larger research project on Quebec nationalism.]

- 1 They were probably right because in a survey 77.3 per centsaid the biggest factor determining their choice was their 'pride in being Quebeckers', others came afterwards. G and M, October 24, 1995.
- 2 The Question "Do you agree that Quebec should become Sovereign after having made a formal offer to Canada for a new Economic and Political partnership within the scope of the Bill respecting the future of Quebec and the Agreement signed on June 12, 1995"
- 3 The term 'sovereignty' has in all poll questions yielded a higher proportion of support in favour of independence than the term 'separation'. This is because some voters equate the former with provincial autonomy rather than formation of a new state. In the first study on separation carried out in 1963, it was found that while only 13 per cent were in favour of separation, as many as 26 per cent considered the independence of Quebec as both 'desirable' and 'workable'. For a discussion, see Maurice Pinard, 'The Independence Issue and the Polarisation of the Electorate: The 1973 Quebec 'Election', Canadian Journal of Political Science, Vol 10, No 2, June 1977, pp 215-60.
- 4 These were contained in the Ottawa document of the federal government which went into the question of secession. It he'd it to be unconstitutional and suggested ways to stop it, G and M, October 21, 1995.
- 5 B C premier Michael Harcourt told Quebeckers in spring 1995, that if they voted for sovereignty they would be transformed from the 'best of friends' to 'the worst of enemies'. So did R Romanov of Saskatechewan and R Klein of Alberta. 'Westerners in no Mood to Accommodate to Quebec', G and M, September 8, 1995.
- 6 'Cree Wave Referendum Flat at Separatists'.

  Ottawa Citizen, September 22, 1995.
- 7 These aspects of the post-referendum situation were mentioned by James Tully, McGill University, Montrael, in an extended discussion with him in June 1996

# **US Authorised Kurdish Massacre**

Vijay Prashad

The Americans eat turkey to celebrate their massacre of the Amerindians; Turkey, the nation, runs amok conducting our own contemporary massacres, first the Armenians and now, the Kurds.

BURIED in the inside pages of the first section in the Sunday New York Times (September 8) comes a short note that the Turkish army last week was busy attacking the Kurds. On page 14, the Times offers an Associated Press report that the US secretary of state, Warren Christopher, "gave Turkey a green light today [7th] to send troops into northern Iraq to create a buffer zone against attacks on Turkish territory by Kurdish guerrillas". Can Turkey play the trustworthy role of peacekeeper which is so often left to the beleaguered UN troops? Do the Kurdish factions trust the Turks? Which 'Kurdish guerrillas' have attacked Turkish territory?

The story offers one detail which itself demonstrates the lack of trust felt by the Kurds for the Turkish regime a couple of weeks ago: the Turkish air force attacked position held by the Workers' Party of Kurdistan (PKK) in south-eastern Turkey. The Turkish government, since the 1920s, has conducted a fierce counter-insurgency and military campaign against the Kurds and, from the 1970s, their principal Turkish party, the PKK as well as against the various Iraqi Kurdish factions which work along the border (both the Kurdish Democratic Party of Iraq (KDP) and the Patriotic Union of Kurdistan (PUK)). Simultaneously, Kemafism and its organs have ruthlessly attempted to undermine the cultural life of the Kurds - it is de facto illegal, for instance, to speak any Kurdish dialect in the confines of Turkey. Given this history, why has the US allowed the Turks to enter Iraq and participate in the most recent carnage?

Al-Hayat, from Damascus in Syna, reports that the KDP(-I) did not only sign 'points of understanding' with Saddam Hussein (which enabled them to obliterate the PUK from Arbil and Sulaimaniya (from the southern Kurdish districts), but also forced an agreement with the Turkish government of Suleyman Demirel The Ankara-Kurd agreement, Al-Hayat notes, authorised the Turkish government to "undertake to expel the PKK forces from northern Iraq". Further, the "Turkish army and intelligence would be allowed to pursue this party's elements into Iraqi Kurdistan, and that Barzani would protect the Iraq-Turkey oil pipeline" Two points need to be made from this report.

First, KDP(I)'s deal with Baghdad and Ankara has sealed the fate of the Kurdish liberation movement, since it has enabled the Iraqis and the Turks to justify (on the pretext of an invitation from the beleaguered 'representatives' of the Kurds) its military activities to those guardians of the New World Order, the US and the UN. Kurdish resistance in Turkey has a glorious history: it begins with the Shaikh Said revolt in February 1925 which was crushed by the Kemalist regime's mobilisation of 10,000 men and 23 aircraft. The Mount Ararat revolt followed in 1930 and the Turks sent in 65,000 men in June to exterminate the Kurds. The Turkish regime promulgated an ordinance (July 29, 1931) which declared that the killing of Kurds in the Ararat region "will not be considered crimes." Deportations followed the killings. Then, the Dersim revolt of 1936-38 involved the Turkish army in a war with devastating results: the Kurdish resistance was effectively ended until the late 1950s. The Menderes coup in 1960 was inaugurated by the arrest of 485 Kurdish leaders. The net result was that the Turkish Workers' Party, a Marxist formation, orgamised among the Kurds and introduced Marxist Leninist notions; the TWP's second leader. Mehmet Alı Aslan was a Kurdish lawyer. This convergence brought the heavy hand of the Turkish government on both the Kurds and the TWP. Radical Kurds formed the Socialist Party of Turkish Kurdistan (SPTK) in 1971 (after another coup in Turkey) which was demolished by the government in the 1980 coup. The PKK, formed in 1975, is the current Marxist party which leads the Kurds. The anti-Marxist and anti-Communist flavour of Euro-America enabled the Turks to continue a genocidal campaign to liquidate the Kurdish people. A glance at two Amnesty reports, EUR 44/24/95 and EUR 44/01/95, is illustrative as is the document by Terres Des Femmes (Depeschen aus der Turkei und Kurdistan, published from Bochum in Germany in 1995). Now, we hear, the US gives Turkey the right to further its aggression into the domains controlled by the PKK.

Second, the oil-flow from Iraq (despite the US embargo) will continue, but now through the aegis of a monopoly transporter (the KDP(I) rather than through both KDP (I) and PUK territory (previously both profited from the tariffs, which was one of the main reasons for their dispute). Saddam Hussem's victory does not just give Baghdad control over the northern regions, but it also allows for a streamlined transport of oil from Iraq to the international markets.

Footnote: The September 9 bombing of southern Iraq has immediately benefited the oil monopolies. In 1994-95, the bench-mark North Sea Brent Crude Oil sold at \$17.07; in 1995-96, the price rose to \$18.63. This rise has benefited from the effects of a gradual withdrawal of Iraqi oil from the market. Moments after the cruise missile attack, the oil price rose to \$23.50 and it soon stabilised to \$22. So much for the separation between 'politics', the 'military' and the 'economy.

Turkey, a member of the European Community, is exempt from the pathetic moralising which infects American governmental discourse. As a 'European' power, it is allowed to act independently, for it is deemed to have a moral conscience. Iraq is bombed for doing pretty much the same things as Turkey. The Americans eat turkey to celebrate their own massacre of the Amerindians; Turkey, the nation, runs amok conducting our own contemporary massacres – first the Armenians and now the Kurds. And the Americans, "give the green light..."

# WOMEN'S WRITING : TEXT AND CONTEXT

Edited by : JASBIR JAIN

This collection of twenty-nine papers focus on the theoretical issues and historical perspectives, with spatial metaphors and discourse analysis, with cultural constructs and linguistic textures, with myth and mythologising and history and dehistoricising. Rebellion, defiance, madness, fantasy, and comedy are some of the strategies used by women writiers to communicate and get their meaning across.

The contributors include Jasbir Jain, Sarla Palkar, Santosh Gupta, C. Vijayshree, Viney Kirpal, Iqbal Kaur, and Ranjana Harish.

# Pakistan: Religion, Politics and Society

Asghar Ali Engineer

The attempts of Jinnah, Maulana Maududi and Zia to Islamise Pakistan society, instead of upholding Quranic principles, aimed to placate influential sections within the polity. In contrast, the thought of Maulana Azad and Maulana Madani, stressing universalism and composite nationalism, came nearer to Quranic injunctions.

1

WAS Pakistan created for Islam or for Muslims, is an important question. There is divided opinion on this. Some ideologues of Pakistan would like to maintain that Pakistan was primarily created for establishing an Islamic state in the Indian sub-continent. Others, who view things more analytically than ideologically, would seriously doubt this proposition. They would rather uphold the view that Pakistan was created to serve the interests of a section of Muslims in pre-independent India. The fact that Maulana Maududi, the founder of the Jamat-e-Islami, kept away from the Pakistan movement, goes to show that. The Maulana was an ideologue of an Islamic state. He had no interest in a secular Pakistan of Jinnah's dream. The Maulana's lack of interest in the Pakistan movement was on account of Jinnah's lack of interest in an Islamic state. Jinnah's main fight was for proper share in power for Muslims and he propounded the theory of two nations only when the Congress slighted him after the 1937 elections in the United Province (UP) and did not take the two Mislim League ministers in the UP cabinet, as informally agreed upon by the Congress.

Even the two nation theory as propounded by the League does not have religious overtones; it laid more emphasis on cultural rather than religious differences. Speaking about the two nation! theory, Jinnah said:

..But surely, it is flagrant disregard of the past history of the subcontinent of India as well as the fundamental Islamic conception of society vis-a vis that of Hinduism to characterise them as mere 'superstitions'. Notwithstanding thousand years of close contact, nationalities which are as divergent today as ever, cannot at any time be expected to transform themselves into one nation merely by means of subjecting them to a democratic constitution and holding them forcibly together by unnatural and artificial methods of British parliamentary statutes. What the unitary government of India for 150 years had failed to achieve cannot be realised by the imposition of a central federal government. It is inconceivable that the fiat or the writ of a government so constituted can ever command a willing and loyal obedience throughout the subcontinent by various nationalities except by means of armed force behind it (Sharif al-Mujahid, 1985:491).

Here it will be clearly seen that Jinnah is emphasising nationality, rather than religious aspect of the problem. And when he tries to make religious argument, he falters and gives examples which are hardly convincing. For example he says:

It is extremely difficult to appreciate why our Hindu triends fail to understand the real nature of Islam and Hinduism. They are no religions in the strict sense of the word, but are, in fact, different distinct social orders and it is a dream that the Hindus and Muslims can ever evolve a common nationality, and this misconception of one Indian nation has gone far beyond the limits and is the cause of most of our troubles and will lead India to destruction if we fail to revise our notions in time. The Hindus and Muslims belong to two different religious philosophies, social customs, literature. They neither intermarry. nor interdine together and, indeed they belong to two different civilisations which are based mainly on conflicting ideas and conceptions. It is quite clear that Hindus and Mussalmans derive their inspiration from different sources of history. They have different epics, different heroes and different episodes. Very often the hero of one is a foe of the other and, likewise their victories and defeats overlap. To voke together two such nations under a single state... must lead to growing discontent and final destruction of any fabric that may be so built up for the government of such a state (ibid, p 492).

All the reasons cited here for incompatibility of Hindus and Muslims to live under common nation by Jinnah are hardly convincing for a discerning mind. It is more of a rhetoric than objective reality. The problem is that Jinnah was far from being a theologian or a religious scholar. He did not know the religion he was talking about. His knowledge of Islamic theology, *Qur'an* and hadith was nearly zero. He, therefore, chose to give examples from history,

society and culture to prove the incompatibility of the two communities. He talks about Hindus and Muslims belonging to "two different religious philosophies, social customs, literature". Religious philosophies, except certain common minimum beliefs, differ from sect to sect in one religious framework also. For example, there are fundamental differences in religious philosophy of the Sunni Muslims and the Ismaili Muslims, between Wahabis and Sunnis, Shias and Sunnis and they do fight against each other, and quite violently, at times. No wonder then that we find violent conflict between these sects of Islam in Pakistan.

It is also to be noted that though religion is an important contributing factor for culture, it is not the only factor. The spiritual expression of culture owes itself to other factors, apart from religion such as language, values, local customs and traditions, food, weather, mode of dressing, dances and music and so on. Despite following the same religion, people can have different cultures. For example, the Arab Islamic culture is quite distinct from north Indian Islamic culture; and north Indian Islamic culture has its own variants from south Indian Islamic culture. North Indian culture was deeply influenced both by Hinduism and Islam and hence it was often referred to as a composite culture. Both Hindus and Muslims jointly enriched this culture in the fields of music, painting, dances, dresses, foods, behavioural mannerisms, language and religiophilosophical thoughts. Often it was difficult to distinguish between a Moghul and a Rajput prince or princess from outward appearance. Similarly, a Muslim peasant in a UP or a Bengali village could hardly be distinguished from a Hindu peasant. Their linguistic dialects were also almost similar with minor differences.

Thus, if the two nation theory was based on such factors then it had hardly any validity. In Pakistan the two nation theory received a hard blow when the Bengali Muslims seceded from it. Their Muslimness could not be accommodated with their Bengaliness. Also, the Mohajirs - essentially the north Indian Urdu and Gujarati speaking Muslims - are now embroiled in conflict with the Sindhi speaking Muslims on one hand, and Punjabi speaking Muslims, on the other Even after nearly 50 years of their existence in Pakistan, the Urdu speaking Muslims very much carry the stigma of being muhajir i e, immigrants from outside. It should also be noted that the Urdu, Sindhi and Punjab speaking Muslims are quite proud of their distinctive cultural traditions.

While Jinnah, not being a theologian emphasises differences between Hindus and

Muslims, two most eminent theologians of pre-independence India and his (Jinnah's) contemporaries, Maulana Abul Kalam Azad and Maulana Husain Ahmad Madani put all the emphasis on what is common between them. Maulana Abul Kalam Azad propounded the concepts of wahdat-e-din and rububivah (i e, unity of religion and sustenance) which emphasises commonness and unity. Thus, Maulana Azad defines the concept of rububiyat as follows: "Rububiyat is a process of tender or careful nourishment providing from moment to moment and from stage to stage all that one needs to gain the fullest possible development. And this process is always to be marked by the touch of tenderness: for, no activity which is not actuated by this can claim to be regarded as Rububiyat". The rububiyat, it should be noted, is universal and not particular in its application. Thus, Maulana Azad says, "The Qur'an often refers to the value of the good things of life and the measure of each measured out to every living object, and thus points to the fact of life that nature provides everything in a particular measure and this under a particular system of plan". This, rububiyat applies to every living being in a particular measure. No living being can be deprived of Allah's function of rububiyat. The Maulana, further emphasising this commonness, observes: "The strangest thing about this scheme of Providence, though the most patent, is its uniformity and the harmony underlying it. The method and manner of providing means of sustenance for every object of existence are the same everywhere. Thus, according to the concept of rububiyat, Allah makes no distinction between one human being and another, believer or nonbeliever. The Maulana puts great emphasis on this concept and its universality'

Maulana Azad also explicates his concept of wahdat-e-din in the first volume of his Tarjuman al-Qur'an. Azad quotes two important verses in this respect: "And they say, 'None but Jews or Christians shall enter Paradise', This is their wish. Say: Give your proofs if you speak the truth. But they who set their face with resignation God-ward, and do what is right, - their reward is with their Lord; no fear shall come on them, neither shall they grieve" (2:106). Then he quotes the verse (2:59), "Verily, they who believe (Muslims) and they who follow the Jewish religion, and the Christians, and the Sabaeans - whosoever believes in God and the last day, and doeth that which is right, shall have their reward with their Lord: fear shall not come upon them, neither shall they grieve". Then Maulana Azad comments: "Din or the real religion was thus devotion to God and righteous living. It was not a name for any group formation. Whatever the race or community or country one belonged to, if only he believed in God and did

righteous deeds, he was a follower of the Din of God, and salvation was his reward".

Azad maintains that this is essence of Din which leads to wahdat (unity). Real Din does not divide, it unites. But the followers of every religion drew a circle around their religion to distinguish it from others and considered the others as on wrong path. Maulana observes, "The concept of faith and righteous living was thus relegated to the background. One might be an ardent devotee of God and practice intensely righteous living, but if he happened to be outside the circle of Judaism or of Christianity, no Jew or Christian would regard him as the 'rightly guided'...". Then he goes on to say, "The Qur'an discountenances this attitude. It proclaims that divine quidance or Hidayat cannot be confined within such man-made limits. Whatever one's race or community or affiliation, he who offers sincere devotion to God and lives a righteous life, he has attained salvation and no tear shall come upon him."

Maulana Azad thus never accepted manmade distinctions as against clear divine injunctions for unity of humankind. He also thought that the very name Pakistan is un-Islamic as entire universe, let alone the earth, has been created by God and no one part of it could be holy (Pakistan). He also repeatedly advised Muslims not to be misled by the propaganda of the Muslim League.

Similarly, another eminent theologian, Maulana Husain Ahmed Madani, the rector of Darul-'Ulum, Deoband, rejected Jinnah's two nation theory and justified the concept of composite nation on the basis of Qur'an and the Prophet's sunnah. He wrote a book Muttahida Qaumiyat Aur Islam (Islam and Composite Nationalism) in reply to Iqbal's rejection of the concept of nationalism. Discussing various aspects, Madani argues that in the Our'an the gaumiyat (1 c. nationhood) of the prophets and unbelievers is the same. Thus, the kuffar (unbelievers) and mushrikm (1 e, polytheists) share their nationality with the prophet. Also, the prophet speaks same language as the unbelievers and polytheists. Thus, the Qur'an repeatedly uses the words like qaum-c-Nuh, quam-e-Ibrahim, gaum-c-Musa, etc., which clearly indicate that the prophets shared qaumiyat with unbelievers and polytheists.

Madani proceeds to say that people living in India have language, residence, race in common, and the foreign government, to realise its goals, has crushed these commonalities. Indians are being decimated by the foreign power. Therefore, Indians should unite to throw away this yoke of foreign rule. This can be realised only through composite nationalism and unity of entire country. For this purpose, to unite with non-Muslims is part of the Prophet's sunnah. Madani gives the example of the Prophet's

attempt at building a united community (Quum or Ummat) in Madina with Jews, Muslims, etc. by drawing up a detailed pact between them giving each religious group full freedom to practice their own religion. The Maulana quotes several clauses from this pact in Madina to prove the need for the Muslims to form united nationalist front with Hindus and others in India.

Madani considers Islam is a flexible religion. A Muslim, according to him, can live with non-Muslims in the same country, can enter into treaty with them, can live in peace with them and can enter into contracts of sale and purchase, can take and give loan, can trust them. He can share sorrows and joys, can participate in marriage and funeral with them, can eat and drink with them. A Muslim can enter into the country of unbelievers, can live there permanently, can marry their daughters (daughters of Christians and Jews). There are many such laws and rules in Islamic shari'ah which are tolerant and open, Islam gives full freedom to others to preach and practice then religion and practice their own personal law and protect their own culture

The Maulana compares this with the declaration of the Congress in 1885 whose main purpose was to unite (politically) all different communities into one nation. Yet, it repeatedly assured that all Indians will be free in matters of religion, culture, personal law, etc. The All-India Congress session of 1931 also made similar declaration and promised to give fundamental rights to the citizens of India.

Thus, Maulana Azad and Maulana Husain Ahmed Madani, unlike Jinnah, take very different view of Islam and reconcile it successfully to the needs of modern composite nationalism. Jinnah, however, who was never initiated into theological discipline, advocates separatism on the basis of religion.

Jinnah argued for cultural differences between Hindus and Muslims, so radical that one cannot reconcile them. But, significantly, cultural differences by themselves do not cause conflict; the real cause of conflict is power and sharing of resources. The Sindhis in Pakistan feel that the Muhajirs usurped their lagitimate share in job, and political offices 'reducing them to secondary citizens in their own homeland. The Punjabil too felt that they being in majority, the Mahajirs have no right to monopolise the top jobs in bureaucracy and army and politica offices. After the formation of Pakistan, the Muhajirs held the top jobs, specially in bureau cracy and politics. G M Syed, who stood with Jinnah at the time of formation o Pakistan, soon realised his mistake and begai to demand an independent Sindhu Desh.

Thus, in ultimate analysis, it is not cultura or religious differences, but power-sharin; arrangements between different religious

linguistic or cultural communities which really matter. Jinnah was a highly westernised person, quite indifferent to religious beliefs and practices. Yet, when slighted by the Congress leaders, he fought for the Muslim elite and their share in power with great verve and ultimately succeeded in creating Pakistan. Jinnah was votary of Hindu-Mulsim unity up to 1928 and pleaded with the Congress leaders to accept certain demands of Muslims so as to save Indian unity. The most important demand of the Muslim elites led by Jinnah was to give one-third share in power to Muslims in the central legislature. As pointed out by Azad, in his India Wins Freedom, the Congress leaders made a vital mistake by refusing to share power with the Muslim League after 1937 elections in the UP. The two nation theory was thus founded, not on religious but political differences. It was not a religious réquirement but a political exigency.

Yet, as noted above, prominent 'Ulama of the subcontinent like Maulana Husain Ahmed Madani, Maulana Hifzur Rehman and several others vehemently opposed Jinnah and his two nation theory. In fact, the Qur'an throws a challenge to the believers to coexist with others. It says: "For every one of you We appointed a law and a way. And if Allah had pleased He would have made you a single people, but that He might try you in what He gave you. So vie one with another in virtuous deeds" (5:48). Thus, Allah's intention is that people of different religious persuasions and different communities should coexist and live in peace and harmony. Madani knew better than Jinnah that there is no justification for the two nation theory in the holy scripture of Islam.

Maulana Maududi, the founder of Jamate-Islami, did not support Jinnah's movement for Pakistan as it was 'un-Islamic' in character. Jinnah's concept of Pakistan was essentially secular. He never thought of establishing an Islamic state. Thus, the chief justice of Pakistan, Muhammad Munir says in his book From Jinnah to Zia, "There can be no doubt that Jinnah was a secularist and against theocracy In his speech to the Constituent Assembly on 11th August 1947 he had given a picture of Pakistan which was nothing short of a secular state in which Muslims and non-Muslims could live together and be its citizens, with equal rights of citizenship, and that religion would be a private affair of the individual, having nothing to do with the administration of the state" (p xv).

The objective resolution declaring Pakistan an Islamic state could be passed only after six months of Jinnah's death. It was introduced by the prime minister Liaqut Ali Khan. According to Justice Munir, it was "quite contrary to the Quaid-i-Azam's conception of the state". "The non-Muslims".

he writes, "complained against it saying that in the state envisaged by that resolution their position would be that of Zimmis, contrary to what the Quaid-i-Azam had declared. But since they were in a minority and Liaqat Ali Khan would not change his stand, they walked out of the Assembly and the Resolution was passed" (Ibid).

#### II

Even after passing the objective resolution, the process of Islamisation of Pakistan did not begin. Islam was declared the state religion, but by and large, Pakistani state and social structure continued to be secular. Ayub Khan who captured power in 1956, in spite being a military dictator, was a broad-minded person. But, as pointed out by Justice Munir, he had no party of his own. "If he had party of his own", observes Justice Munir, "the history of Pakistan would have been different... He had omitted the word 'Islamic' from the name of the state" (p xvii).

Ayub resorted to the concept of basic democracy and the basic democrats approved his constitution of 1962 which omitted the concept of fundamental rights. In the preamble to that constitution he had referred to Islamic principles of equality, justice and tolerance. Ayub in fact took on the conservative and orthodox forces in Pakistan society though he could not always have his way. But in certain respects he stood firm. He fully supported the demand for change in Muslim personal law and issued the Family Laws Ordinance in 1962. Ayub appointed a commission headed by Sir Abdur Rashid, chief justice of the Supreme Court to re-examine the matters relating to the inheritance of grandson's. right to inherit his pre-deceased father's property, question of triple divorce and polygamy.

The commission recommended that the law on all three points was being wrongly interpreted by the traditionists and gave their opinion against all the three points. They held that the grandson in the circumstances could not be excluded by his uncles from his grandfather's property; the restriction on the wife remarrying her husband and consummating the marriage, on being divorced by him was wrong; the right of the husband taking another wife in the presence of his first wife without assigning any reason, though was lawful, it made him liable to fine if done without the permission of the arbitration council.

Later, the Ayub government issued an ordinance on these lines. The traditional 'ulama protested against it and wanted the ordinance to be repealed while women were for its retention. The Ayub regime stood firm and the ordinance was not withdrawn. No subsequent regime, including that of Muhammad Zia-ul-Haq, could repeal it. This ordinance benefited the women in Pakistan. According to it, marriage and divorce need to be registered with the arbitration council.

The Jamat-e-Islami headed by Maulana Abul A'ala Maududi in Pakistan was a conservative force. The Jamat considered itself *Hizbullah*, i.e., party of Allah, and the Maulana theorised that in an Islamic regime, only one party, i.e., the Party of Allah could exist. Maududi stood for a theocratic state which he described in Islam as a theodemocratic state. But interestingly, while Maududi talks of only one party, the 'ulama in Pakistan are divided into several parties and have fundamental differences with each other. They do not hesitate to issue fatwas of *Kufr* against the other. No two Ulama, as pointed out by Justice Munir in his report,

agreed on the definition of Muslim and yet were practically unanimous that all who disagreed should be put to death (vide Munir Commission Report, Labore, 1954:218-19). It is also interesting that while Maududi's Jamat-e-Islami believes that a woman cannot be a head of an Islamic state, the Maulana supported, in 1962, the candidature of Fatima Jinnah (Jinnah's sister) for presidentship of Pakistan. It was sheer political opportunism.

According to Maududi, rule of God will prevail in an Islamic state. If Muslims are sincere to their religion and faith, they must then struggle to impose Shari'ah, the law of God. For Maududi, anyone who opposes imposition of God's rule as advocated by him, is an enemy. Maududi maintains that cordial relations with the non-Muslims is not the real aim of an Islamic society; on the contrary, its real aim is to impose God's rule over the society even if it means confrontation with the non-Muslims. Real peace, according to Maududi, can be established only if all submit to the law of God, i e, only when the non-Muslims reconcile themselves to the establishment of the Islamic rule [see Maududi, Islami Riyasat 1974:631.

The important question here is who will decide what constitutes rule of God. Whose view will prevail in this respect? The Maulana even maintains that even the elected parliament will have no right to legislate; it will have authority only to impose shari'ah law. According to him sovereignty belongs only to Allah, not to legislative body elected by human beings. Human beings have only to submit to the soveregnty of Allah. In fact, the concept of sovereignty of God is derived from the Qur'anic verses like 11:45 where Allah is described as Ahkum al-Hakimin which is rendered as 'ruler of the rulers'. In fact, it carries the concept of justness and it should be translated as 'justest of the just'. He has also been described as Khayrul Hakimin, i e, the Best of Judges in

For persons like Maududi sovercignty of God in fact means sovereignty of the Jamate-Islami and its interpretation of shari'ah. People will have to submit to the officebearers of the Jamat. In fact the concept of sovereignty of God has to be properly understood. Sovereignty of Allah can never mean sovereignty of jurists. The Shari'ah law cannot be static and immutable. It is the principle of justice and equality which is supreme and all laws must be just and equitable. The position that even a legislative body in an Islamic country cannot legislate is totally untenable. Even the holy Prophet had permitted Ma'adh bin Jabal to take resort to ijtihad (mental efforts to understand new situation and accordingly apply the injunctions of the Qur'an and sunnah). New situations arise and new legislations are needed, and old legislations need to be rethought. What is unalterable is basic principles and values, not their applications in given circumstances.

Entire legislation concerning women, marriage and divorce laws needs to be revised in the light of Qur'anic spirit. In fact many Shari'ah laws pertaining to women are not even in accord with the Qur'anic legislation or are based on interpretations of the Qur'anic verses which are loaded in favour of men. It is therefore necessary to take a fresh look at these Shari'ah laws. In Iran women have succeeded in getting a law passed treating household work as paid work. This obviously was an appropriate interpretation of the Islamic principles.

Pakistan went through severe crisis after Bangladesh separated from it. Zulfigar Ali Bhutto was highly ambitious and authoritarian man. He was partly responsible for partition of Pakistan in 1971. When he assumed power after separation of Bangladesh, he behaved like a despot. When a mass movement led by religious leaders started in 1977, he almost panicked and went on making concession after concession to please the 'Ulama and other fundamentalists. Earlier he declared the Qadiyanis as non-Muslims under pressure from the fundamentalist elements and started to persecute them. This was beginning of a period of religious bigotry in Pakistan. Though Bhutto was a modernist and not inclined towards religiosity like Jinnah, he used religion to appease the bigoted religious leadership of Pakistan to buy time and to stabilise his regime.

But of course, Pakistan went through its most conservative period during Zia-ul-Hag's time. Zia, both on account of his beliefs and political needs, sought to impose conservative Islam. He made Islam his main political constituency. When he declared Pakistan to be an Islamic state in the late 1970s, he did so by enforcing hudud punishments, i.e., cuting off hands of thieves, lashing the drunkards or stoning adulterers to death. To be sure, this is not the essence of an Islamic state. An Islamic state, above all, should strive to establish a just society and take care of its weaker sections. The Qur'an lays great stress on socio-economic justice and accords special place to the marginalised in the society called mustad'ifin in the Our'anic terminology. The Our'an maintains that the dynamics of social structure works on dialectical interaction between the mustakhirin and mustad'ıfin (i e, the powerful and arrogant, and the weak and the oppressed). Thus, an ideal Islamic society will tend to be just and equitable. The key Our anic terms in this respect are 'adl and ihsan (i e. justice and benevolence).

The Pakistani society since its establishment has favoured the powerful and influential feudal, bureaucratic and military

elite. The oppressed and the marginalised always remained at the receiving end of the highly exploitative system in Pakistan. Though the Prophet had prohibited absentee landlords sharing crop with cultivators (muhaliqu or mukhahira) it has been rampant in Pakistan since its formation. It is a well known fact that the feudal clite have enjoyed unprecedented power in Pakistan. An Islamic society could be anything but feudal in structure. No ruler in Pakistan has ever tried, let alone succeeded, in breaking the back of teudalism. If anything they have only reinforced it, whatever the political rhetoric.

Zulfiqar Ali Bhutto who framed the first democratic constitution of Pakistan after a long spell of military dictatorship, never pretended to establish an Islamic order, though he gradually surrendered to the conservative Islamic forces in Pakistan. In his election campaign he promised rotic kapada aur makan (bread, cloth and shelter) to the poor and needy of Pakistan, while caught the imagination of people. However, it proved to be more rhetoric. Bhutto could not even carry out proper land reforms. Thus, the rural poor had no respite in Pakistan. The lot of urban poor has been no better

The Islamisation during the Zia's period had no such pretensions. Zia immself had no deeper knowledge of Islamic theology or jurisprudence. He was solely guided by the conservative 'ulama. At the most, he sought to enforce zakat system, i.e., collecting zakat from economically well off and distributing it among the poor and needy. The collection of zakat created controversy and the Shi'as refused to pay it through bank cuts. Zia at last had to exempt the Shi'ahs from payment of zakat. The distribution of zakat also gave rise to corruption which is even otherwise rampant in Pakistan. Zia only succeeded in enforcing certain Islamic juristic provisions as far as his Islamisation was concerned. Some of the shari'ah rules he enforced, like declaring women as half witnesses, naturally created controversies. It is really doubtful whether the Qur'an really treats women as half witnesses. That is how the jurists interpreted it in their context. It is difficult to categorically show that women are half witnesses according to the Qur'an. Yet Zia could not withdraw the Muslim family law ordinance issued by Ayub.

Thus, the Islamic society of Pakistan has been like any other society, highly exploitative and unjust and was sought to be Islamised by mere implementation of certain formal juristic measures evolved by the 'Ulama under the influence of their own social context. These formalistic measures cannot be expected to bring about the desired Qui'anic transformation of society. A Qui'anic society has to be just, humane, benevolent progressive and dynamic. The Pakistani society is fai from this.

# **Law and Women**

#### S P Sathe

Subversive Sites: Feminist Engagements with Law in India by Ratna Kapur and Brenda Cossman; Sage Publications, New Delhi, 1996; pp 352, Rs 200.

THE book under review departs from the existing literature on women and law, moving away from the dichotomous description of law either as sustainer and legitimiser of oppression of women or an instrument of social change and undertakes an analysis of the complexity and the contradictory nature of law. The authors try to find out why law and legal actors produce results contrary to what women activists expect of them. The authors admit that "the terrain of law is much more complex, in both the oppression of women and in its premise for challenging that oppression". Legal discourse has constructed women as gendered subjects as wives and mothers - as subordinates, in need of protection and thereby contributed to the subordination of women. At the same time law has been a site where roles and identities of women as subordinates are being challenged. It is a site used by social reformers and women activists for subverting the existing roles and identities of women and reconstructing their roles and identities as persons, human beings entitled to equal rights. This is a very positive view of law.

The main thrust of the book is to reveal how legal regulation of women is informed by an ideology, which the authors call familial ideology. By familial ideology the authors mean the set of norms, values and assumptions about the way in which family life is and should be organised, a set of ideas that have been so naturalised and universalised that they have come to dominate common sease thinking about the family. The authors feel that it is important to interrogate the ideological role that law plays in constituting and sustaining the subordination of women. They make an important point that while resisting and deconstructing the familial ideology, "the importance of familial relationships and the roles that women play in their families neither be denied nor devalued". Usually, feminism is often derided by the defenders of patriarchy as being western or unIndian. The above caution of the authors, we hope, would prevent such distortion.

The authors' discussion is around two aspects of familial ideology: (a) moral regulation which lays down the parameters of a 'loyal wife' or a self-sacrificing woman, and (b) economic regulation which sustains

and reinforces woman's economic dependence on man.

While surveying the feminist literature the authors tell us that the journey of feminist engagement with law has passed through three stages, protectionism, equality and challenge to patriarchy. These however do not fall in chronologically exclusive compartments because even today the protectionist approach is not totally forsaken. The first generation of social reformers were doubtless motivated by altruistic considerations, but barring a few exceptions. they had no feminist convictions [Kosambi 1995]. Women became in most cases the mere sites for those controversies which acquired nationalist overtones because of the resistance to colonial legal intervention. After nearly 200 years we witness a similar story being repeated in the case of Muslim women who have become sites for a controversy on uniform civil code between majoritarian nationalists who invoke secularism in support of the homogenisation of the family law and the Muslim fundamentalists who resist any legal intervention on the ground that their personal law is not open to legal regulation.

The social scientists writing on the age of consent controversy often seem to mistake it for age of marriage. Age of consent pertained to the age of a girl below which her consent did not offer any defence to the person accused of rape under Section 375 of the Indian Penal Code. The controversy was regarding the raising of such age from 10 to 12 years. The authors of this book also use the expression 'age of consent' in describing the provisions of the Child Marriage Restraint Act. There is a clear distinction between these two expressions and they ought not to be used interchangeably because the age of consent made an act of sexual intercourse with a girl below the age of 12 an offence of rape even if such sexual intercourse was committed by the husband on his wife There was a furore against this since child marriages took place with girls as young as less than 12 years of age, but it had nothing to do with child marriage because it did not prescribe any minimum age of marriage.

The second phase was of insistence on women's rights and particularly on assertion of equality. The authors have given

inadequate attention to the Gandhian phase of the national movement in which women's participation significantly increased. Gandhi spoke traditional idiom but in a very subtle way liberated women from the stranglehold of patriarchal tradition. Subtle feminisation of politics by the Mahatma with its emphasis on non-violence, sacrifice and suffering, thereby universalising what were supposed to be women's virtues, indirectly catalysed women participation in politics paving the way for a women's movement for equality. The authors rightly observe that "by the 1930s, this equal rights discourse, and its emphasis on achieving equality for women within economic, political and familial spheres, had displaced the discourse of women's uplift which had dominated the eartier movement". The equality paradigm, however, suffers from a dilemma. While the protectionists treated wemen as weak and in need of protection, the equal rights protagonists assumed that women were equal to men in all respects and therefore demanded formal equality. The third approach of patriarchy took for granted that law was essentially patriarchal and merely blamed it for being so. The authors address themselves to the following questions: Is law a discursive site? They argue in favour of revisioning the role of law. They state that law can be seen as a discursive struggle where reformers and activists seek to challenge and displace dominant understanding of gender, tradition and culture. Feminist legal scholarship must explore the question of role of law from a multiplicity of perspectives. Law facilitates change and also obstructs it. It reinforces woman subordination and also provides an important source of resistance and change.

The authors survey the judicial decisions on various subjects including matrimonial disputes and constitutional rights. They conclude that the judicial approach to the cases is dominated by the influence of familial ideology on the judges. In this connection, the authors should have referred to a controversy on the censorship of a film called 'Pati Parmeshwar'. The film showed how a woman through her sacrifice and suffering changes the heart of her husband who had taken fancy for another woman. When objection was taken to its exhibition on the ground that it glorified servility in a woman, and the matter went in appeal to the high court, all the judges except Justice Lentin, who heard the matter successively found nothing wrong in that kind of depiction of a woman. It is remarkable that all the judges who applauded the film were Hindus and the only dissenter. Justice Lentin was a Christian. That shows that familial ideology

is not the same with all the sections of the Indian community [Jaising 1988].

Besides familial ideology, the pro-accused bias of the criminal justice system, which is a product of legal liberalism, is also responsible for judicial decisions which tend to frustrate reforms in the law of rape as well as regarding violence against women. In fact, the influence of familial ideology should have made the judges less kind towards the accused in child rape cases. Why are child rape victims subjected to further victimisation during trials in courts? Although we agree with the authors that familial ideology does influence and bring about gendered perceptions of facts as well as persons involved, the authors should also undertake a critical analysis of the legal professional culture that prevails in the entire Anglo-Saxon legal systems including India which is not less responsible for such bias.

The authors rightly say that "the judicial approach to sex discrimination is overwhelmingly influenced by a formal approach to equality, and often a protectionist approach to gender difference, which has operated to preclude any entitlement to equality". With the help of the cases the authors have established this point very convincingly. In the Air India case, the judges upheld a provision of the Air India Regulations which forbade the air hostesses to get married before completion of four years of service. Two considerations seem to have weighed upon the minds of the judges. First that such a provision would support the population policy of the state and would help limit the birth rate. Another that in the absence of such a provision, the air hostesses getting married might ask for maternity leave and that would increase the financial liability of the Air India. The population policy consideration is a typical higher middle class obsession. There are people who are willing to consider even authoritarian measures for achieving it. The second was a purely capitalist concern. Another provision of the same regulations which compelled an air hostess to resign on first pregnancy was held invalid by the judges. But Nariman arguing on behalf of the Air India had submitted to the court that he could persuade the Air India to change that rule to apply on the third pregnancy. This had obviously reference to the "not more than two children" campaign of the family planning programme. It is another thing that the judges did not uphold the provision because no concrete proposal had emerged, but the judges had welcomed that suggestion [Sathe 1981]. Now was this due to familial ideology alone or did male chauvinism, patriotic authoritarianism (birth control) or class ideology also influence them? Soumitra (the adultery case) reflected the patronising attitude of the judge towards women. In saying that women are often seduced but are rarely the seducers, was he complimenting women or praising the present limitations on women's liberty which compel them to be virtuous? [Sathe 1993]

The authors observe that "feminism should not advocate an approach that unreflectively recognises gender difference, nor one that unequivocally denies its relevance". The case of the bar waitresses needs to be considered from this point of view. Should they be allowed freedom to work at late night hours even though they are most likely to be sexually exploited? Or should the state prohibit them from working at night in order to protect them? The third alternative is for the state to protect them against sexual exploitation. The second alternative is often preferred because it gives protection at the cost of liberty and indirectly subserves the patriarchal ideology. If bar waitresses are to be allowed their right to work without the sacrifice of their dignity, the state will have to intervene decisively with an affirmative action such as providing escort for the waitresses while going home at night.

The authors did not have the benefit of the recent decisions of the courts in which a significant change in judicial attitude is visible. The Supreme Court has been increasingly using Article 21 of the Constitution (which guarantees that a person shall not be deprived of her life and personal liberty without the procedure established by law) for integrating women's rights into the fundamental rights in order to overcome the limitations of the formal equality provided by the reasonable classification theory under Article 14 of the Constitution. This strategy of mainstreaming gender does not only include women's rights within the fold of the fundamental rights but also reconceptualises the fundamental rights by engendering them. In a case, the court took objection to the interrogations of a woman applicant for iob regarding her menstrual cycles and pregnancies on the ground that they invaded her right to privacy (Neera Mathur vs LIC). In another case, the court declared that rape was not a mere offence under the Indian Penal Code but was violation of woman's right to live with dignity. The Supreme Court held that an act of living with a woman by making her feel that she was wedded to him when in fact she was not amounted to rape (Bodhi Sattwa Gautam vs Subhira Chakraborty). The court in a maintenance case discouraged roving enquiries into the patrimony of a child born in wedlock and thereby demolished the presumption that woman had to prove her chastity whenever man demanded (Gautam Kunda vs West Bengal) [see Sathe forthcoming]. What do these decisions indicate? Do they indicate that familial ideology has been subverted? We do not think so. But we can certainly say that influence of familial ideology is weakening. The change is taking place slowly but that such a change is taking place cannot be denied. It is taking place not only because of the pressure of women's movement but also because generally a climate more favourable to human rights is emerging. The Supreme Court asking the trial court to take up prosecution against a high police official like K P S Gill is not an accident (Rupal Bajaj vs K P S Gill).

It does not mean that all women will be as fortunate as Bajaj. The class distinctions, the access and resources would doubtless still make a great difference. But the judicial activism unleashed due to institutional reasons and the politics of change cannot now refuse to develop women's rights to their logical end. Familial ideology will doubtless change but not wholly disappear. Familial ideology needs to be reconstructed, not banished. Marriage must be a voluntary union of two persons of the opposite sex. (It may in course of time also be a marriage of two persons of the same sex.) Marriage must be based on equality and therefore subversion of familial ideology must be desired insofar as it sustains and legitimises woman's subordination. There are some good elements in familial ideology. It fosters respect for women [Kishwar 1995].

The authors' analysis of Hindu rights discourse and the role model of a woman is interesting. All religio-nationalistic forces tend to be male chauvinistic. The Hindu rights paradigm glorifies the mother/ loyal wife role model in the same way as the Nazis glorified it. All patriotic/nationalistic formations rely on physical power for the liberation of the motherland or rejuvenation of a racial/ethnic superiority and masculinity is considered as a great asset. The peculiar characteristic of the Hindutva paradigm is that it combines male chauvinism with antiwest sentiments and camouflages it with anti-colonialism. It caricatures women's movement as being anti-traditional and unnatural. But the Hindu rights people are not alone in this. Even die-hard Gandhians like Rajendra Prasad opposed reforms in Hindu law and several persons appeared before the B N Rau Committee on Hindu Law Reform to oppose abolition of polygamy and inheritance rights to daughters. It was said that such reforms in Hindu law would bring about the disintegration of family, which was an important social institution. Familial ideology is not confined to the Hindutva forces alone. The Hindutva lobby which includes BJP, RSS, Shiv Sena, VHP and Bajrang Dal have appropriated the women's cause without sharing the ideology of feminism. They would grant a special status to woman and place her on very high pedestal as long as she functions within the limits of patriarchy. There are, however, quite a few in the secular parties who are equally chauvinistic. The recent fiasco of the constitutional amendment bill providing for reserved seats for women in legislatures amply demonstrate this.

The debate on uniform civil code, as the authors rightly point out must be taken out of the syndrome of secularism and formal equality. Uniform civil code for the majoritarian forces is a means of homogenisation of the personal laws but for feminists it should be a means of engendering the family laws. National integration is not going to be reopardised if people continue to have multiple personal laws. What is necessary is that these personal laws must by critiqued from the perspective of substantive equality between man and woman and also between women irrespective of their religion. The statement in the government of India's affidavit filed before the Supreme Court in response to the order of Justice Kuldip Singh in Sarla Mudgal that a uniform civil code would restrict the freedom of religion of the minorities is dangerous because personal law was never considered as part of the freedom of religion. The debates on the uniform civil code and freedom of religion in the constituent assembly of India clearly show that the makers of the Constitution did their best to meticulously draw the scope of that freedom so that it should not come in the way of social reform [Dhagamwar 1989]. Freedom of religion, unless circumscribed, could threaten the progress of social reform including reform in support of feminism. While it is necessary to refute unmistakably the arguments advanced by the Hindutva brigade on uniform civil code, care must be taken not to be with those who are opposing uniform civil code on fundamentalist assumptions.

The authors take a dynamic view of law, not merely as a set of norms but as a process and one of the processes used in feminist struggle. Through engagement with law, women's movement has doubtless increased women's participation in decision-making. We have witnessed such engagements through litigation, law reform and legal literacy.

On the whole, this is a very good effort to study law as one of the inputs of the process of social change. It provides a very valuable critical literature on feminist study of law.

Structural Adjustment: Economy, Environment and Social Concerns edited by Shoba Raghuram, Heiko Sievers and Vinod Vyasulu; Macmillan India, 1995; pp 324, price not stated.

THIS collection of papers serves an important need of the general reader to understand the basic issues that are implicated in the reform process called structural adjustment. Many of the contributors are well known economists who have done much to promote our understanding of the Indian economy. The volume's readability and straightforward expositions of points of view are refreshing. At the time of publication of the book, SAP had already been in place for four years and there was no point in asking was it necessary or could it have been otherwise and in that sense the editors' remark that "debate notwithstanding, several economists have implicitly accepted the need for stabilisation measures and the irreversibility of the structural adjustment process" is valid. Nontheless the tone of inevitability as if we were victims of a blind fate is to discount the past misdemeanours of our policy-makers.

The focus of the book is on how the reform process will affect industry, agriculture, social security and environment. In reviewing and assessing the components of the package of reforms, the papers draw out the implicit and fallacious assumptions underlying the expectations that these reforms will unleash the forces of growth. They suggest what options lay before us if we are seriously concerned with the welfare of the people and especially the vulnerable and disadvantaged among us. If development is about eradicating poverty, the long-term as well as short-term consequences of the present policy trends bode ill. This is the main message that comes through from most of the papers. Secondly, while SAP has been introduced uniformly in many countries, the relative success or failure will depend a great deal on the preconditions that exist, the specific context and content of economic development in each case and hence there can be no one lesson be it from east Asia or China. If at all such lessons are there, they emphasise the need for a prior strengthening of the economy through adequate social development, infrastructure building, creating appropriate institutions including non-fragmented, well functioning markets and above all, selective state support.

The book is non-polemical, taking no extreme positions but arguing for a realistic understanding of the structural rigidities in our economy whose loosening is unlikely to take place by a misplaced rolling back of the state on the basis of a blind faith in the market's miraculous powers. The editorial note states that they have tried to bring in a plurality of views but actually barring two or three dissenting notes, the majority of the contributions agree on the basic question which is, not whether SAP is necessary or not but is it compatible with the real goals of development and whether it can impart the degree of dynamism to turn a low technology economy such as ours into an internationally competitive and highly productive economy. The merit of the book hes in emphasising what structural changes are necessary before this can happen.

There are four sections - the first section dealing with general issues and some references to other Asian countries who have been held up as models for our emulation. The second one goes into details about the specific problems of agriculture and why SAP as implemented will fail to solve the basic problems of Indian agriculture. The third focuses on food and social security requirements and analyses the existing programmes, their inadequacy and how their winding up will make matters worse. The last section is on environment issues. The best sections are the first and second. The 30-page introduction gives a competent summary of each paper as well as laying out the genesis of the crisis from the lost decades of the 1980s to the brink situation in the 1990s. The World Bank itself had in the meantime modified its carlier more rigid stand on privatisation and liberalisation to make allowances for safety nets. While supporting de-bureaucratisation, the editors argue for allocation to more research to develop technology, frown on unselective entry of multinationals, stress the building up of substantial support system to manage the transition period when labour is likely to be retrenched and redistributive measures to shore up the entitlements of the poor to guarantee their basic needs.

Arun Ghosh's opening piece gives a good overview of the important elements of economic reforms and their implications. Normally a distinction is made between stabilisation, a short-term measure to manage the fiscal deficit (devaluation of the rupee, curtailment of budgetary support for public investment, sale of part equity of public sector units and high interest rates) and structural adjustment, which is long term and is concerned with liberalisation of the economy by removing controls and licensing on industry and agriculture, trade liberalisation, domestic and foreign, reduction of tariffs, freer imports and exports and doing away of subsidies, etc. Ghosh makes an important observation that the two are not distinct but shade off into each other and that the means adopted for stabilisation such as high interest rates, has profound effects on the long-term adjustment process. With the abolition of priority sectors, banks can use profit criteria and no longer worry about social need. With less importance given to branch expansion in rural areas rural development will be inhibited and largescale distress will ensue among the smallscale units and artisans. In terms of actual performance, he shows that industry has stagnated after the reform and recovery thereafter is slow and nowhere near the 1980s. As for trends in agriculture before the reform period, the already low public investment in agriculture which was only one-fifth of plan outlay till the Third Plan, has further got reduced to one-eighth of plan outlay. Tracing events between 1950 to 1990, he points to wide discrepancies in foodgrain production as between states, how consumption levels are below national levels in several states including the highly industrialised state of Maharashtra, decline in labour absorbtion in agriculture because there was no increase in cropping intensity; size of landholdings which are already below one hectare and are declining further, increasing number of marginal farmers, inadequate institutional credit as problems that require urgent attention if agriculture has to become capable of responding to new opportunities.

Most of the authors worry about lack of concern in the new policy for food security and employment generation. Ghosh also points out that public sector enterprises are not all of the same category and there are efficient ones as well as inefficient ones. As many other commentators in recent times have remarked wryly, the haste with which PSUs have been divested is akin to selling the family silver for a five-star dinner.

Mohan Rao pleads for an active but the right quality of state intervntion by showing how much advance India had made in

building a diversified industrial base and how ironic it is that liberalisation has come in the wake of a decade of high economic growth. The crisis is not due to insufficient liberalisation (which began in the 1980s) but that one set of constraints were relaxed but simultaneously another set came into operation. "Judging what liberalisation can do for economic growth must depend on what factors are understood to have constrained growth in India, past and present and how liberalisation may be expected to act on those constraints" (p 70). The durable foundations of underdevelopment are severely deficient infrastructure, low levels of education, agricultural backwardness, structural dualism, large inequalities, persistent technical lag in industry and a weak home market. These are unlikely to be uprooted by a liberal regime.

Most of the authors also stress the political precondition for growth in the form of participatory and decentralised institutions. In this section, Patki Reddy gives an account of China's example in rural industrialisation - the TNVs. He does not however elaborate on the strategies followed by China to prevent urban migration - the labour contract system by which a worker is recruited through state agencies on a six-month permit only; the formation of collectives and later the household responsibility system and most importantly land reform and public investment in education and health as well as a powerful nationalistic fervour to make China strong.

Hans Christoph Reiger is a lone protagonist of liberalisation in the volume. He argues with data from east and south-east Asia that growth and equity are not incompatible and that growth in these countries has not increased inequality or increased poverty. What he has failed to note is that these countries had more egalitarian societies than ours to begin with. His data purports to show that inequality has lessened but the interesting thing is, first, the figures of reduction in inequality when compared with the GDP size and growth in those countries, are not impressive; secondly, one would like to know what proportion of national product does the upper 20 per cent consume? His own comparison of India's performance through anti-poverty measures in reducing poverty with the wealthier Asian countries shows that despite poor economic growth we did not do too badly in reducing poverty when compared with the fast growing east Asia. His thesis that growth reduces inequality is not really substantiated by his ambiguous data. At the most what it amounts to saying is growth need not increase inequality. But even this depends on the initial conditions. On the environment question he admits that rapid growth has severely worsened the environment in Indonesia, Thailand but contends that lack of growth and poverty would have led to the same condition or even a worse plight. This is manifestly false. The rapidity with which Indonesia is plundering its rain forests is quantitatively and qualitatively different from the exploitation of natural resources by the poor. S L Shetty draws attention to the initial conditions these countries achieved before they liberalised. Giving appropriate data, he shows that reforms in India has not achieved any of its own declared objectives - inflation control, agricultural and industrial growth or even any significant increase in exports. The scenario is pessimistic with development expenditure of the government going down and domestic savings reaching lower levels.

In the section on agriculture, many of the observations made above are reiterated and there is some amount of overlap. Krishnaswamy sounds a warning note against the hope placed on exports of agricultural products and the trend towards agribusiness. These may be fiscally attractive but the costs in terms of equity and social stability will be high. Modernisation accompanying concentration of land and commercialisation of agriculture through shifts to cash crops will jeopardise food security; the assumption that surplus labour from rural areas can be absorbed by growth of industry is unlikely given the low labour absorption of industry. China even after decades of high growth has been unable to solve this problem. Vyas's paper is actually more about environment. He contends that the poor are not responsible for depletion of natural resources. On the contrary, because they depend on them for survival, they tend to take better care of the resources. He advocates the promotion of systems that will increase the access of the poor to natural resources and the creation of institutions that will facilitate and regulate the effective use of resources. Winfried von Urff on the other hand harps on the need to shift from non-tradables to tradables and accepts the world bank line of reform for agriculture - abolish subsidies, free markets, encourage exports. He swears by the 'getting prices right' approach that ignores the structural impediments.

In the section on social security the papers give new conceptual approaches. Guhantalks of three categories – promotional, preventive and protective security. Reforms in design and implementation of existing schemes can be of great help for example scrapping IRDP and instead introduce an easy, broad-based credit scheme. Alternatives to EGS must be found where at present out of every hundred rupees the beneficiary actually gets only Rs 22! PDS too needs much reform. Many are now advocating food stamps as a better way of targeting the poor. Old age pension, maternity benefits, disability assistance and survivor compensation are a must. Joy

Deshmukh demonstrates the role of the household as a buffer and how gender relations within the household make the impact of reforms particularly negative for women. Her dissection of the household as a producing, consuming and distributive unit is a conceptual advance over conventional notions of the household as an undifferentiated collective. The paper by Pushpa Pathak gives empirical support to the negative effects on women's employment. The effect on women and workers are predictable from what we know of globalisation in most countries. The following features have accompanied globalisation, which is nothing more than capitalism coming to fruition. (i) degradation of labour, where workers are separated from control over work and even in the first world, labour is managed by stress, (ii) feminisation of labour with more female participation in the workforce but at unequal and discriminatory terms, (iii) housewifisation where not merely the workforce but work itself takes on the characterisation of housewifery - low skill, low status and low paid, (iv) informalisation throughout working and subcontracting and (v) casualisation with part time, short-term contracts. More than 80 per cent of the new jobs are 'bad' jobs in the advanced countries.

The last section on environment is treated very generally and does not really go into the debates on sustainability. Michael Redclift whose writings in this area are familiar to many of us concludes by stating categorically that the environment problems are the structural consequences of development process and present trends will severely strain the capacity of the environment as source, sink and service. In this context recent reports about India importing toxic waste from the US are alarming. This is liberalisation gone crazy. Ramaswamy Iyer's is a lone voice in the book in questioning the growth model itself whether with or without social justice. He argues for a limit to growth and moderation of humanity's draft on and abuse of natural resources by opting for a Gandhian approach. Amiya Bagchi's paper included here is on the unequal power relations, economic and political between the North and the South. He sees SAP clearly as an imperialist design of the North continued from colonial times. He sees no possibility of redirection until North-South relations become more equal.

To conclude, the book, in the main, stands by a Nehruvian model with some necessary corrections. To that extent it underestimates the political impasse of the present. It is interesting that the voices of big business who yesterday were singing paens of praise for liberalisation, now faced with the prospect of losing protection are not so keen on TNCs coming in. Operating in a protected domestic market meant that its size and profitability

had to depend on the volume of state expenditures. The market, not being a mass market was limited by the unwillingness of the state to push through going agrarian reforms which alone would have increased the purchasing power of the rural masses. Instead the state opted for subsidies and tax concessions to the rich, turned a blind eye to tax evasion. Big business looked forward to reforms in the hope that in return for a share in the domestic consumer goods market. they would get a share in the international market. Indian industry had failed to use the protection to create competitive capacities and was content to make profits from imported technologies. TNCs under the invitation for free entry did not choose to enter into partnership with Indian big business that would give the latter a share in the international market. The TNCs hiked their equity shares in firms they already controlled; other new investors purchased domestic market shares from Indian operators like Coca Cola buying up Parle's. Where Indian big business tried to haggle over shares, TNCs dropped them in favour of smaller partners. Since the reforms began, 78 per cent of foreign investment has been to buy shares in Indian companies or buying up Indian companies. The most severe indictment of the reforms is that now in

1995, 96, the twin goals of the programme. fiscal prudence and growth are nowhere in sight. The index of agricultural production in the reform period is 2.0 per cent on the average as compared to 4.5 per cent in the period 1986-87 to 1990-91; industrial production has picked up as between the two periods but only marginally - from 8.4 per cent to 8.9 per cent: GDP growth at 1980-81 prices, hovers around a low of 4.7 per cent for the period 1991-91 to 1995-96 (the latest CSO estimate according to press reports is 6.6 per cent for 1995-96 and investment is reported as 25 per cent but one has to see whether this is going to be sustained). The most dismal performance of course is in employment where the average annual rate of growth in the organised sector is just 1 per cent. While the consumption levels of the bottom 30 per cent of the people have fallen the expenditure on consumer durables of the top 10 per cent has risen sharply. The rich have benefited with growing business opportunities and the middle class with well paying job opportunities.

What awaits us under the new coalition government is unlikely to be anything spectacular either in terms of economic recovery or poverty reduction going by the contradictory policy measures announced in the common minimum programme.

# Language and Its Identities in Contemporary Karnataka

#### Janaki Nair

Kannada nationalism, like all nationalisms, attempts to produce a solidarity between all Kannada speakers in order to efface the specificities of caste and class, and pits itself against other dominated minorities rather than addressing the hierarchical division of labour that has ensured Kannada's dominated status. As long as it continues to privilege the identity of Kannada over other democratic aspirations, the movement will tend increasingly towards alignment with strident communal or anti-minority forces. The movement encompasses a range of moderate and progressive intellectual positions, which have of late been overshadowed by the more strident voices. There is the danger that in the context of the structural changes already under way, benefiting a few at the expense of the rest, the ideology of the movement while expressing genuine anxieties may tend towards undemocratic resolutions of its identity crisis.

THERE is a familiar ring to the way in which Kannada nationalism, currently in the making, is crowded with memorics of historic lacks, of opportunities missed, of inadequacies past and present. After all, the founding moment of Indian nationalism too was a necessary confrontation of the reasons for subcontinent's subjugation by an alien, exploitative power.2 Where Kannada nationalism struck a different chord, right from its start during the days of colonial rule. was in measuring itself and its madequacies not against the overarching triumphs of the imperial power but against the more modest successes of other linguistic nationalisms within India itself. Alur Venkat Rao's anguished response in 1920 to the nationalist imperative that "We don't have a history! We must have a history!" recognised that it was only through a recast history of the Kannada people that the Indian nation could be imagined, but more importantly deplored the fact that his effort came a full 40 or 50 years after his Bengali, Marathi and Hindi counterparts had made their heroes and historic triumphs part of the Indian common sense.4 Just after the demand for a linguistic Kannada province was conceded by the Indian National Congress in 1920, there was explicitly expressed envy for the "the rich modern literature of modern (stc) vernaculars like Bengali, Marathi and Telugu." The absence, until as recently as 1956, of a unified administration under which the Kannada peoples could develop continues to haunt even contemporary historical accounts." If the 'real Congress struggle' got off to a late and timid start in (Bombay) Karnataka (heralded by the 1930 salt satyagraha), it was ironically because of an administrative identity on which nationalist politics could build was unavailable.7 More recently, even 'tolerance' widely regarded as a virtue, has been recast as yet another obstacle to the full-blooded citizenship of Kannada speakers: thus L S Seshagiri Rao

said during the Cauvery riots of 1991, "The Kannadigas have been tolerant always but they have awakened to their rights now" (*The Tunes of India*, December 2, 1991).

Since the narrativisation of Kannada's modern identity has been somewhat overwhelmed by the sense that it is unoriginal, weak, even imitative, the significance of a massive and indisputable presence has been marginalised, understated or overlooked. Of the various political administrations under which the Kannada speakers lived, the princely state of Mysore, nominally independent, was best poised to articulate the cultural aspirations of the Kannada people within the framework of the nation state. Yet the impetus for shaping Kannada's identity came not from Mysore but the Bombay Karnataka region where a Marathi national identity was fairly well developed by the end of the 19th century. Mysore instead was noted throughout the colonial period and by its historians for its other achievements. Tipu Sultan himself has been acknowledged as the earliest mobiliser of state resources in the struggle against the British,\* but by the late 19th century, the bureaucracy of the princely state forged a paradigm of development which, while unmistakeably nationalist, strove to usher in a legal and economic modernity by relying entirely on the instrumentalities of the state. State-sponsored industrialisation is the most well known of Mysore's achievements, but equally significant was the legislative agenda that set the pace for improved rights of Hindu women under law in 1930, 'and accepted the principle of reservations for non-brahmins in 1921.10 The state thus absorbed the nationalist agenda restricting severely the conditions of possibility for a public sphere to develop. "tenuing to suffocate non-state institutions of civil society by theoretically equating the principle of public good with the institutional form of state control".11 There were for instance, caste associations that came up in the early years of the 20th century but they too remained somewhat limited in their scope and reach at least until the 1930s.<sup>12</sup>

Many historians of Mysore have been content to attribute this absence of civil associations to the idiosyncrasies of individual dewans or to the generally autocratic nature of the princely bureaucracy.13 in what has become a characteristic refusal to acknowledge the significance of the displacement of the agenda of cultural nationalism by an agenda of state-sponsored economic and legal modernisation.14 Yet we know that the state, not the people, loomed large even in the imagination of cultural nationalists searching for patrons and sponsors of a rejuvenated Kannada: thus, B M Srikantia made the plea in 1915 at the Mysore Economic Conference that

governments concerned with Kannada areas will, as they have been doing already, encourage writers systematically and on settled principles, and may even see the way to establish a soit of academy with power to lay down general principles to map out a course of production and to reward any work that is done in an excellent manner and to print and distribute it if necessary among the people at large <sup>15</sup>

It need not surprise us that when the 'academy' was established as the Kannada Sanitya Parishat in 1915, it was as part of Dewan Visvesvaraya's overall vision of Mysore's material progress and welfare. This pre-independence envisioning of the state as the prime mover in building a sense of nationhood may be distinguished from the latter day demands for control over the apparatuses of the nation-state, as we shall see below, but the continuities cannot be ignored. The state of the state as the prime mover in building a sense of nationhood may be distinguished from the latter day demands for control over the apparatuses of the nation-state, as we shall see below, but the continuities cannot be ignored.

The displacement of cultural nationalism by economic nationalism in the colonial period is critical to any discussion of the predicament of the Kannada movement today, which rather than being a latecomer to linguistic and communal identities, has tashioned a different path to modernity.

fraught with unexpected anxieties that have violently manifested themselves in the past two decades. For there is another register on which contemporary Kannada's muted (until recently) political identity appears as a distinct advantage vis-a-vis other states. Favourably endowed with an impressive technological personnel base, a scientific establishment and a state that has long favoured industrial development, Karnataka, and more properly Bangalore, have been actively promoted as exceptionally wellpoised for integration into the new world economic order.18 On this register, the growth of the state's economy appears to have a momentum of its own, on which the recent assertions of Kannada identity have served as a frustrating ideological drag.

Yet it is clear that the very features that made Bangalore/Karnataka an attractive location for the realisation of global ambitions are destined to be transfigured by the force and violence that accompanies the economic shifts that are being envisaged. The past two decades in Karnataka, which have been punctuated by movements against some policies of the state on the one hand and against some minorities on the other, testify to a violent renegotiation of the terrain of development between those who are poised to benefit most from Karnataka's globalising trends, and those who seek a stake in it.19 Broadly, these two sides may be characterised by their respective linguistic markers, i.e. the users of English and Kannada respectively a diglossia in crisis, where a nationalist elite which was thoroughly bilingual (knowing English as well as the regional language) has yielded space to two, or more, resolutely unilingual groups.24 Kannada nationalism today is thus a beleagured nationalism, since it functions within a severely segmented linguistic market.21 It possesses neither the will nor the resources to combat the hegemonic presence of English as the language of science, technology and indeed global capitalism. It cannot, in other words, challenge the dominated position to which it has been relegated. Instead, it displaces its demands onto the politico-cultural sphere, through what has long been perceived as the prime mover, the state, which is also a far from insignificant distributor of resources.

At this conjuncture, the milder forms of Kannada nationalism have been eclipsed by the far more strident versions. Given that it does not yet harness the democratic political energies of those who are critical of current social transformations, this nationalism ranges itself against the languages of subaltern groups, such as Tamil and Urdu speakers in Karnataka, and seeks its allies from among communal groups, overshadowing the milder variants that range from a benign linguistic pride to passionate cultural a truly unified linguistic market nor a democratic transformative vision. Kannada nationalism is content to remain within the parameters of a segmented linguistic market. largely abandoning the field of economic and technological dominance to English while striving for politically legitimate authority through the agency of the state and against other minorities. The Kannada movement thus retains the split between dominant economic and technological languages and the legitimate sphere of politico-cultural languages. From within this narrowly defined sphere of legitimate political and cultural authority, this regionalist discourse aspires to become a "performative discourse which aims to impose as legitimate a new definition of the frontiers and to get people to know and recognise the region that is thus delimited in opposition to the dominant definition".22 It is critical therefore to identify the elements that this regionalist nationalism assembles in the course of its self-definition.73

But first, a word about the spatial dimensions of Kannada identity, which is symptomatic of the contemporary Kannada movement's primary anxieties. Karnataka is unusually rich in the number of languages spoken by its inhabitants, which includes Telugu, Urdu, Tamil and Marathi, as well as Tulu, Konkani and Kodagu, apart from the 65 percent who owe allegiance to Kannada alone.<sup>24</sup> Yet of the three significant moments in the language politics of the past 15 years, ie, the Gokak agitation of 1982, the Cauvery agitation of 1991 and the agitation against the Urdu telecast in 1994 what was an impressive all-Karnataka affair in 1982 (Gokak), with an organising nucleus based in Hubli-Dharwar, was restricted, during the Cauvery agitation, to a struggle over jobs. land and water in southern Karnataka.25 The anti-Urdu agitation, which revolved around the question of the visibility of Kannada as the official language, was more or less confined to the state capital. It is no coincidence that the Karnataka intelligentsia, which had shown a remarkable degree of unity in the first two agitations,26 were much less unanimous on the third, more, symbolic issue, although the protagonists were in turn able to forge new solidarities with Hindu communal forces. In other words, securing the identity of Kannada through attacks on linguistic minorities is restricted to those areas where, for historical reasons, there are substantial and visible minorities subsisting in regions of high economic growth, namely in southern Karnataka and particularly in urban areas such as Bangalore and Mysore, rather than Bellary, Bijapur or Belgaum.

The development of Bangalore as a city, as well as the role it is assigned to play in the refigured global order, have made it a

nationalists. With neither the possibility of • site of such differ contention that it has come to speak for the predicament of Kannada and Kannadigas throughout Karnataka. Historically, the division of the city between the colonial cantonment (east) and the old city (west)<sup>27</sup> produced on the one hand areas with a polyglot legacy and on the other areas that were relatively monolingual. One aspect of this cultural uniqueness is that Kannada speakers account for about 34 per cent of the city - although contrary to the widespread belief, Kannada speakers constitute the single largest group of people, followed by Tamil (25 per cent) Urdu (19 per cent) and Telugu (17 per cent).28 The other, and equally important fact is that some parts of the city have large segments of minority religious populations, Christian and Muslim, identified with languages other than Kannada, whereas more recent migrants to the city are both primarily Kannada-speaking and Hindu. The most violent manifestations of Kannada identity have occurred where demographic change and economic realignments are sharpest, that is, in the western and north west parts of the city (The Hindu, December 14, Deccan Herald, December 14, The Hindu December 17, 1991.) It was in Bangalore, rather than in the deindustrialised KGF area that physical attacks on Tamil speakers were most acute during the Cauvery riots, and within Bangalore itself, the older eastern parts of the city, such as Ulsoor, where equations between old and new migrants are more stable, were comparatively free of violence compared with areas flush with new migrants.

Not surprisingly, some of the strongest memories of Kannada's underdevelopment are associated with the historic demographic and economic profile of this city<sup>29</sup> even when they concern issues that do not pertain specifically to Bangalore. Testifying before the Venkatesh Commission that enquired into the anti-Tamil riots during the Cauvery agitation, the president of Kannada Shakti Kendra Chidananand Murthy said that Bangalore's Kannada speakers were on the decline, and that there should be a check on the migrant influx. 30 Bangalore after all, is not only the administrative capital of the state but is also the location of several public sector industries as well as large private ones, and is preparing to take its place as a major site for information technology. To an extent, Bangalore exemplifies and even exaggerates the hierarchical division of labour between languages that has come to stay, whether in the realms of work, culture, governance or religion, and linguistic politics reiterates the violence of the structural changes which are under way today.

## LANGUAGE OF WORK

The 'tolerance' of Kannadigas to which many testified during the Cauvery Riots of 1991 (The Times of India, December 22,

1991) is an interesting instance of reinterpreting the existence of substantial linguistic and ethnic minorities in Karnataka although the large-scale mobilisation of labour in the gold mines (KGF), textile mills, plantations and after the 1940s, the public sector, was determined by considerations in which the Kannada people played little or no part Generally, we may say that the broad-based agrarian structure of Old Mysore practically climinated the need for migration until at least the 1950s; on the other hand, the inhospitability of the continguous droughtprone tracts of Tamil Nadu drove landed and landless labourers off the land and into cities such as KGF and Bangalore. 11 Memories of the underdevelopment of Kannada speakers nevertheless persist among Tamil workers. who attribute their own presence in Karnataka to their natural propensities for 'hard work' or 'industrial work' compared with Kannadigas in the past,32 while Kannada speakers who are forced to provide explanations for the preponderance of non-Kannadigas in the labour force of KGF, Bangalore and Bhadravathi speak of historic injustices. The high proportion of Kannadigas who comprise the working population of the industrial town of Hosur, 40 miles from Bangalore but in Tamil Nadu, does not appear to challenge the dominance of these views, any more than the presence of large numbers of agricultural landlords and workers in Gudalur and Ooty does

The push from the Karnataka agrarian hinterland into the cities became pronounced from the mid-1950s, a trend that has been attested by studies of slum populations. While 67 per cent of Kannada slum dwellers came to Bangalore after 1954, roughly the same percentage (63 per cent) of Tamils had migrated before that year, after which there was a sharp drop, and numbers continue to decline although Tamils continue to account for sizeable proportion of lower end immigrants.<sup>43</sup>

Yet even in 1983, Prakasa Rao claimed that "more migrants born outside [Karnataka] came in search of employment than migrants born in Karnataka" Despite this apparent "lack of interest" in industrial work, which has been ideologically cathected as an aversion to 'hard work', by the 1960s, active efforts were made to mobilise resentment against patterns of recruitment to eminently desirable public sector jobs. In what was conveniently aligned with a management offensive against an influential communist (AITUC) union at BEL, for instance, the Karmika Sangha (or the Workers' Unity Forum) was encouraged, beginning in 1967, to unionise Kannada speakers on a linguistic basis. This incitement to union-breaking happily coincided with a period of massive public sector expansion, when Kannada recruitment increased by leaps and bounds

even as Tamil/Malayali recruitment dropped off as a result of new personnel policies, aided in part by the fact that ITIs within Karnataka itself provided a ready recruiting ground. Nevertheless at the start of the Gokak agitation, Subrahmanya, the general secretary of the Vimana Kharkhana Karnataka Sangha claimed that of the 23,000 HAL employees, "only 5-7000 (sic) are Kannadigas" (Deccan Herald, April 11, 1982)

The significance of the mid-1960s recruitment drive to public sector industries extends beyond the mere replacement of one linguistic group with another. The caste/ class origins of the new entrants differed substantially from previous migrants as well. Many of the new workers at BEL were members of the agrarian landowning vokkaliga caste, from rural and non-working class backgrounds. Tamil workers, for example, had been primarily from the lower castes and very often from working class and even urban backgrounds, coming from towns such as Vellore and Coimbatore (interview with M S Rao). At the same time, Bangalore has long been characterised as a middle class city on the basis of low slum population (10 per cent compared with 25 per cent in cities like Madras in the mid-1970s), and the preponderance of middle income earners. "This was true even in that decade of pheno-menal growth, 1971-81, when Bangalore's population swelled by more than 70 per cent. 46

The middle-classness of the city is only likely to be further accentuated given the economic changes that are being envisaged for the city, with the planned generation of more white collar and service oriented jobs 37 Unlike KGF city, which is overwhelmingly Tamil, and is rapidly deindustrialised and deurbanised, despite protests, Bangalore's relatively weak working class profile means that there are fewer jobs for the rural migrants arriving in the city. Given the structural shifts in the industrial landscape, namely away from public sector to private, and from heavy capital goods industries to light consumer industries, service industries, or to highly skilled CNC operations, the Sarojini Mahishi Commission's recommendation that at least 80 per cent of the jobs at the lowest scale in the public sector be reserved for the "sons of the soil" will not yield tangible results and may soon be irrelevant. In fact, this will greatly exacerbate the struggle over the limited resources and jobs that the state controls. The new economic policy, from which Karnataka, especially Bangalore, is slated to benefit, will bypass the majority of subaltern classes, whatever languages they may speak, and control of the political machine itself is seen as an alternative for large sections of the people who are poorly endowed with the desirable economic or cultural capital.

# LANGUAGE OF CULTURE

There was, right from the start, no contest between the 'prestigious enchantress' (English) and the 'sobbing mother' (Kannada). 14 Kannada High schools preparing students for the upper secondary examination at the turn of the century 'did not flourish in competition with English schools' and were therefore abolished in 1935 although Kannada was made the medium of instruction in that year.40 An internationally hegemonic language like English became desirable cultural capital for the Karnataka, indeed the Indian, elite, especially in the absence of a common language in the incipient nation-state. The field of culture was however easter to mark off, to set aside as the domain over which Kannada would preside. The existence of a rich literary tradition, and the output of hitherto suppressed groups such as Dalits and women, have ensured Kannada a secure place as a literary language. Yet this domain too has long borne the marks of hierarchy, given the extremely unequal terms of distribution of linguistic capital between the various segments of the cultural community. Language thus continued to be the bearer of caste and gender markers. In the very first school started at Melkote for brahmin girls, the emphasis was on teaching the literary and fine arts through the medium of Kannada,41 with little or no input on the exact, natural or physical sciences. Indeed, only Kannada was taught because English, far from being merely a medium, was intrinsically bound up with "information offensive to native tradition".42 Only in 1919 were girls' schools reluctantly made bilingual from the middle grade, and this only after an appeal came from the women's movement, though Kannada continued to be the medium of instruction.43 The debate about what should be the language of instruction continued well into the 1940s although the hegemony of English was never breached

B M Srikantia's was among the stray voices that urged the development of a Kannada adequate to the tasks of modern industrial and scientific advance.44 Yet he too made the point feebly, acknowledging instead the sphere within which Kannada was condemned to circulate, envisaging a division of labour where English 'our cultural and political language', Sanskrit 'our spiritual and classical language' and Kannada 'our native and speaking language', could happily co-exist.49 This has been an important legacy for the present since Kannada's alliance with the world of culture has over the years been more firmly established through the efforts of private and state bodies such as the Kannada and culture department. Despite this, there has been, neither in the past nor today, a widespread movement to spreac

literacy or encourage reading, as happened in the library movement of Kerala in the colonial period. The obvious limits of promoting the growth of a language only through the genre of literature has been recognised by several Kannada intellectuals. In this may be a difficult link to challenge even by the current chairman of the Kannada Development Authority, H Narasimhaiah, a scientist.

Yet even the field of 'culture' such as it is, is not uncontestably the domain of Kannada. A national culture is today purveyed throughout the country via the medium of Hindi, which in Karnataka enjoys a dominance that has rarely been questioned:48 Mahadev Banakar even cites the Tamil objection to 'Akashvani' as a symptom of its anti-national stance, a position from which he is anxious to distinguish Kannada.49 Instead, even when there was protest against programmes made in Hindi, such as Sanjay Khan's The Sword of Tippu Sultan (Deccan Herald, December 12, 1991) and Ramanand Sagar's Ramayana (Deccan Herald, August 30, 1994), it was because they were being dubbed for telecast in Kannada rather than being remade in Kannada. There has been recurrent tension between the 'remake lobby' and the dubbers of non-Kannada films. The issue is how best the development of the Kannada language is served: by dubbing non-Kannada films, by 'remaking' non-Kannada films (and providing an impetus for the film industry), or by striving to make Kannada films that can stand up to the competition of other language films. While the 'remake lobby' has complained about the 'lack of story lines, and even directors, the purists see 'remakes' as a kiss of death for the Kannada film industry.50

Despite a measure of pride in the fact that 'films in six languages are shown in the state' the insistence, particularly during moments of crisis, that only Kannada films be seen in theatres in Bangalore and that only Kannada programmes be shown on the channels DDI and DD951 may be seen as an instance of the coercive, rather than persuasive quality of Kannada's limited reign over the culture of Karnataka. The entry of the Rajkuniar Fans' Association into the fray during both the Gokak and the anti-Tamil riots were critical to the scale and intensity of the disturbances, while rallying the entire film industry behind it during the Kannada agitation. "Even when the demand for Kannada telecasts was made, it was in order to monopolise the official channels, since the protagonists of Kannada are acutely aware of the impossibility of voicing opposition to the innumerable private channels that beam programmes in English, Hindi and even Tamil throughout the day. Kannada therefore aspires to monopolise the field of official culture, which is part of a wider aspiration to make Kannada the sole language of governance.

#### LANGUAGE OF GOVERNANCE

Given that the division of labour between different languages has been well established with English at the top of the hierarchy followed by Hindi, it need come as no surprise that the leaders of the Kannada movement aspire to seize and occupy, coercively if necessary, the realm of governance. The state in the Indian case is not merely an administrative structure but an active interventionary force in development of all kinds. In the refigured economy of the state, where, as already mentioned, the thrust is towards a dismantling of the public and encouragement of the private sector, the government, or at least the political class, attempts an active mediation of the economic agendas, to compensate for the domain of jobs and power that have been lost with the decline of the state sector.33 While this can do nothing by way of altering the direction of the change, and indeed may not want to, it can at least secure a substantial part of the benefits that accrue to the initiators of such change.

Of course, there are also instances of sections of the Kannada movement offering serious and even violent critiques of the new economic policy. The KRRS attack on Cargill seeds and Kentucky Fried Chicken, the opposition to the Japanese township and the growing unease about the Cogentrix deal are cases in point, but they remain symbolic, and external to the central concern of the Kannada movement.

The official language is necessarily aligned with the nation-state in its origins and in its social uses, so that Kannada must not only be the official language of the state, but the sole official language in a linguistically plural society. After having secured official language status in 1963,44 Kannada clearly did not make the headway that was envisaged, and the nearly 280 GOs that have been issued in the past 30 years include several that testify to the continued insecurity of Kannada. Despite certain misgivings, and even doubts, the imposition of Kannada, whether as the sole first language in high schools or as the official language, appears as the only viable route of establishing hegemony. The Kannada Development Authority, whose mandate is broader than its predecessors, the Kannada Official Language Committee, the Kannada Official Language Watchdog Committee, and the Kannada Watchdog and Border Advisory Committee, is still struggling with the same issues. Indeed, it is a recognition of the impossibility of even legitimate authority in making language hegemonic that G Narayana, tormer president of the Kannada Development Authority, knowing full well that Kannada will not flourish without a conducive environment' declared 1993-94 as the 'Kannada Awareness Year.'55

A crucial site for the development of any official language is the school system, where a certain degree of compulsion is coupled with the generalised changes in the economy that warrant new knowledges and a mastery of the official language. Yet even Eugen Weber's detailed documentation of the violent processes by which peasants were forced to become Frenchmen, and only as recently as during the period of the first world war, does not minimise the importance of persuasion: when French finally gained ground among the patois speaking peasants, it was "not so much through persecution as through the peasant's growing appreciation of the usefulness of a less parochial language and of the skills learned in schools". The Gokak agitation however, recognising that the generalised conditions for a widespread need for Kannada did not exist, sought to elevate Kannada to the level of the sole first language, a status that no other language has been accorded in the country, by state

Recognising the need to legitimise the official language and consecrate it as the language of the state, Kannada is placed in opposition to other dominated languages -Sanskrit, which is an ossified classical language; Tamil, which in Karnataka is primarily the language of subaltern classes; and Urdu, similarly the language of a dominated minority. The ferociousness of the attack on the Urdu news telecast was thus a protection of the official face of and space for Kannada, and the fear of even minor transgressions into that space.<sup>57</sup> Both the attack on Tamils and their property during the 1991 Cauvery riots and on Muslims during the anti-Urdu agitation in 1994 may be seen as coveting the images of Tamil and Urdu respectively. In the case of Tamil, it is the political and cultural solidarity that is enviable, a political solidarity that has recently been forged, and has enabled a certain dominance even among expatriate subaltern classes. In the case of Urdu too, it is the ability of the language to perpetuate itself and survive despite the absence of an official political structure and despite the fact that the community of speakers is clearly underprivileged. Urdu speakers' solidarity, unlike that of Tamils, springs in part from the solidarity made available by Islam, which more than amply makes up for the absence of a patron state. This excessive identity of Urdu with a religious group is both feared and envied by the Kannada protagonists, although the commonsensical association of Kannada with Hinduism is naturalised, and is therefore beyond interrogation. Briefly tracing the genealogies of the link between language and religion is therefore imperative.

## LANGUAGE OF RELIGION

Most historians of Old Mysore in the late 19th century such as Cha Vasudevayya, Chandrasekhara Sastri. M Singrayya expressed 'raja bhakti', composing court histories and vamsavalis.'\* BM Sri's Kannada Nadina Charitre also remained at the level of a history of the Mysore court. Nationalist redefinition of the Kannada speaking people's history came from outside Mysore. Here too, while there were exceptions such as Raghavendra Krishna Inamati's 1907 work that acknowledged the Muslim heritage, most nationalist histories bore the imprint of a reawakened Hinduism.

Alur Venkat Rao's 1917 conception of 'Karnatakatva' as outlined in Karnataka Gatha Vaihhava was unmistakably grounded in the language of worship, of devotion to the great men of the past. But there was a much more important sense in which the history of the Kannada nation was constructed as the history of the Hindu nation. That lay in the very choice of heroes in Karnataka's past and in the abruptness with which Karnataka's glory comes to an end in 1565 following the battle of Talikota in which the forces of Hinduism were defeated by the forces of Islam:

Having flourished for 230 years this glorious kingdom disappeared in half a minute by accident. It died That was the end of Karnataka's glory The kumkum was wiped off Karnatakadevi's forehead! The mangalsutra round her neck was cut! Karnataka's wealth was destroyed. Karnataka's intellectual wealth disappeared The sun of Karnataka's valour set. To summarise, since that day, we people of Karnataka have become an empty name in history. Oh, ye of Karnataka, has the time still not arrived for a recovery of past glories? Think about it (p. 71).

Not only were the Vijayanagar kings valiant in their defence of 'arya dharma' in the face of a formidable enemy, namely, the Bahmanis, successive dynasties until Vijayanagar, from the Gangas Kadambas, Chalukyas, Rashtrakutas Hoysalas, and Yadavas were protectors of the Kannada language (p 21).

In Alur Venkat Rao's narrative, the bondage of Karnataka began with the defeat of Vijayanagar and had not ended, which was why his account ends with the battle of Talikota. Through a series of clisions, languages acquire a religious identity especially since non-state (non-official) religions are destined to languish and die. Thus, the Bahmani and Adil Shahi court cultures in north Karnataka which in fact paralleled the court of the Wodeyars are held responsible for the decline of Karnatakatva. By such a violent act of self-imposed censorship, the classical heritage of Karnataka remained exclusively Hindu, and

Islam continued to be external to Karnataka's history. Alur's account glides over Karnataka's Jain heritage, the revolutionary doctrines of Basaveswara and completely ignores the subaltern religiosities of the Bijapur/Gulbarga Sufi traditions of the 14th-16th centuries which were often bitterly opposed to the Adil Shahi/Bahmani sultans.<sup>50</sup>

To that extent, Alur Venkat Rao's revisions were even more drastic than the efforts of writers such as Bankimchandra, because of his refusal to name, differentiate or characterise the late medieval period, not even as darkness.<sup>61</sup> If Bankimchandra, despite his analytical break with his historical forebears nevertheless evaded a critique of colonialism and was a liberal before his time, Alur Venkat Rao writing in 1920 was more than amply familiar with the critiques of colonialism that were being generated by the nationalist movement. In his decision to end the history of the glories of Karnataka in 1565, in his refusal to deal with the period that followed as history, and in the tacit gratitude he showed the Orientalist scholars who had put together a coherent account of Karnataka's ancient past, he exercised a judgment, reflecting a view that had already gained currency and resonated well into the 20th century.

In attempting to understand the communal turn taken by the Kannada movement, at least one recent document distinguishes between the pre- and post-independence language movements 62 In the colonial period, it says, the Kannada movement 'presented very democratic points of view' and retained a unity until its goal was achieved, namely, Karnataka's unification. In the post-independence period, however, the pressures of modernisation appear to have caused a split in the constituency. Yet, while appreciating the difficulties of imagining the nation outside the framework of 'devotion', there is no doubt that Alur made specific choices throughout his work in order to rally specific kinds of groups to the cause of Kannada. In that sense, although the commonsensical association of Kannada with Hinduism cannot be without long-term effects, portraying the anti-Urdu agitation as resulting from a 'misuse of the situation by communal interests' is clearly inadequate.63

Instead, we may account for the absence of 'communalism' in the colonial period in quite a different way. At least until the 1930s, the princely states were generally regarded as comparatively free of communal strife. \*\*Communal riots in several princely states such as Travancore and Hyderabad in the latter part of the 1930s forced a revision of this optimistic view. Several historians have speculated on the reasons for this early 'absence'. Ian Copeland suggests in his analysis of Hyderabad that low levels of industrial development and lower levels of

politicisation account for the absence of communal strife; even in 1938, it was British subjects and organisations, rather than Hyderabadi ones, that were responsible for the riots.65 A comparative analysis of two states, Travancore and Baroda, has led Dick Kooiman to conclude that communal leaders emphasised religious identities to more strictly regulate access to the state bureaucracy (as in Travancore); where elite interests were well served by the bureaucracy. as in Baroda, there was relatively little communal violence.<sup>™</sup> According to James Chiriyankandath, early caste or community based activity of the elites was a formative influence on the development of democratic institutions and organisations, especially within the sphere of electoral politics, with enduring consequences.67

Although none of these explanations entirely fit the Mysore case, what they all emphasise is the development of a range of pre-political organisations, whether caste, religion, or language based, and whether or not they redefined the domains of economic, political and social power. Such associations were relatively weak in Baroda<sup>68</sup> and Hyderabad69 (so that communal riots were absent in the former place and instigated by outsiders in the latter) while they were stronger in Travancore.<sup>m</sup> In most parts of Mysore, there was a conspicuous weakness of such associations; if communal riots were rare then, it has to be understood as part of the generally restricted development of the public sphere, where even progressive movements such as women's, peasant or left movements, did not flourish.71 Even the hostility between brahmins and nonbrahmins was more in the nature of elite, 'palace' intrigues, rather than popular upsurges.72

Despite the availability of colonial discourse on the misdeeds of Hyder and Tippu and their followers, then, Mysore was relatively free of communal violence. On the other hand, the avowed 'Hinduness' of the Mysore state permitted the bureaucracy to transform the domain of the social without incurring serious opposition, not even from the Congress, indeed there was a great deal of congruence between Congress and princely state agendas, especially on economic questions. What is more important is the monarchical culture that was kept alive, and the maharaja, whose figurehead status was never in doubt nevertheless stood for forms of power and authority which were distinctly monarchic. This monarchic culture was not proclaimedly secular, and yet wore its Hinduness lightly especially in its unopposed reform of the Mysore social formation.

Today, however, the identification of Kannada with Hinduism has been so thoroughly naturalised that Kannada

Rajyotsava as it is celebrated has assumed the trappings of a minor religious festival, replete with invocations to the goddess of Kannada, Bhuvaneshwari. The relationship of the community of speakers of Kannada to the language is one of devotion or faith, so that more secular celebrations of Rajyotsava, as were attempted by the BEL union, were regarded as sacrilegious.73 Portraits of Kannada Bhuvaneshwari were worshipped at the launch of the Gokak agitation, as if to suggest that respect for the language can only be guaranteed by investing it with a certain religiosity (Deccan Herald. April 3, 1982). Similarly, the Cauvery agitation too evoked images of the symbolic importance of the river for Hindus. It is almost as if the aggressively religious public sphere is developing in tandem with, and in opposition to, the expanded sphere of the secular. And it is no coincidence that such oppositions are exacerbated even as associations in civil society (trade unions and language associations within the public sector industries for example) are flourishing.

We cannot overstate the link between the religious colour of language agitations, since language solidarities in most new nation states have evoked religious motifs. But the speed with which the 1994 agitation against the introduction of Urdu news telecast was transformed into a sustained campaign against the speakers of Urdu, namely Muslims, speaks of a commonsensical association of Kannada with Hinduism and the consolidation of the agenda of Hindu communalism beyond the confines of a specifically 'communal' party. 4 In fact, the Kannada movement had no need for the members of the BJP and even refused them an opportunity to speak at the rally before Doordarshan on October 9, 1994 (The Times of India, October 10, 1994). There is certainly no perfect consonance between the agendas of Karnatakatva and Hindutva though there appears to be enough of an overlap. Thus, while Chidananda Murthy said after the anti-Urdu riots that "Hindus are no more under the control of Mutts, but the Muslims are always bound by what the Mowlvis say",75 Jagdish Karanth, the leader of the Hindu Jagran Vedike, which played a key role in the riots at Bangalore and earlier at Bhatkal, expressed similar sentiments.16

# **DEMOCRACY AND LANGUAGE**

The ideology of the Kannada movement resembles the Shiv Sena movement quite closely especially in the kinds of elements it assembles in its self-definition (Hindu, anti-minority and patriarchal) as well as in its aspirations (control of the political machine), although there are important distinctions." Kannada nationalism, like all nationalisms, attempts to produce a solidarity between all Kannada speakers in order to

efface the specificities of caste and class, and pits itself against other dominated minorities rather than addressing the hierarchical division of labour that has ensured Kannada's dominated status.78

Of the constituent groups that have expressed a more circumspect solidarity with the cause of Kannada in the contemporary political scene,79 the Karnataka Rajya Raitha Sangha alone seems to have attempted a critique of the impact of the new global order, and even produced a vocabulary adequate to such an analysis. 80 The other social movement of significance, the Dalit Sangarsh Samiti, which has often supported the pro-Kannada struggles, has not so far given up its primary identity as a forum for asserting and defending the rights of dalits."

As long as it continues to privilege the identity of Kannada over other democratic aspirations, the Kannada movement will tend increasingly towards alignment with strident communal or anti-minority forces, rather than those critical of the existing establishment and of the promised changes in the economic and political scenario, and muting the milder cultural nationalist forces within the Kannada movement. Even the justified demand for a fair share of Cauvery water in 1991 soon dissolved into an indiscriminate attack on Tamil labourers and landholders in parts of southern Karnataka. Nor does the vociferous participation of subaltern classes necessarily guarantee a more inclusive or democratic agenda. \*2 The Kannada movement encompasses a range of moderate and progressive intellectual positions, which have of late been overshadowed by the more strident voices. Combined with the structural changes that are well under way and which are guaranteed to benefit a few at the expense of the rest, the ideology of the Kannada movement, while often expressing legitimate anxieties, may increasingly tend towards undemocratic resolutions of its identity crisis. It may increasingly, as Vatal Nagaraj ominously threatened on the eve of the agitation against the interim order on Cauvery waters, "speak in a language the centre will understand".

# Notes

['Memories of Underdevelopment' was the name of a memorable Cuban film directed by Tomas Alea. This paper is exploratory, suggesting directions in which the study of contemporary Karnataka may profitably proceed, rather than providing a fully worked out analysis of the predicaments of Karnataka's development today. This paper was prepared for the seminar on 'Social Identities: Religion, Region and Language in Contemporary India, University of Hyderabad, September 14 and 15, 1995, and also presented at the Madras Institute of Development Studies, Madras. Comments from the audience at both places have greatly helped to sharpen my

arguments; I am especially grateful to the readers of the first draft, K Nagarai, MSS Pandian, and Madhava Prasad.]

- 1 As M Chidanandmurthy has said, "A survey of historiography in Kannada during the 19th century clearly shows the lack of nationalist outlook among the Kannada people, more so among the South Karnataka (Old Mysore) People "Murthy, 'Historiography in Kannada during the 19th Century' in Tarashanker Banerjee (ed), Historiography in Modern Indian Languages 1800-1947. (Calcutta: Nay Prokashan, 1987), p 168, emphasis added.

# NATIONAL INSTITUTE OF PUBLIC FINANCE AND POLICY NEW DELHI

INVITES APPLICATIONS FOR THE FOLLOWING POSITIONS: (A) Senior Economist (Three) in the pay scale of Rs 3000 100-3500-125-5000 plus allowances as per Institute's rules. Total emoluments at the minimum of scale will be Rs 917C/- P M Qualifications Essential: (1) Candidates should be Post Graduate in Economics with specialisation in Public Finance, (2) Ph.D Degree obtained on the basis of dissertation in the area of Public Finance, (3) Knowledge of quantitative techniques, (4) Publications of good standard, and (5) Eight years working experience in the post of Economist

Preferred areas of focus are fiscal federalism and centre-state issues, environment economics, poverty and macro-economic framework, structural reforms in the areas of fiscal management taxation and industry (privatisation)

(B) Economist (Three) in the pay scale of Rs 2200-75- 2800-100-4000 plus allowances as per institutes rules Total emoluments at the minimum of scale will be Rs 6788/- P M Qualifications Essential: (1) Candidate should have a High Second Class Post Graduate Degree in Economics (2) Specialisation in Public Finance, knowledge of quantitative techniques and good knowledge of Indian data sources and use

Desirable Two to three years research or teaching experience (C) <u>Librarian</u> (One) in the pay scale of Rs 2200-75- 2800-EB-100-4000 plus other allowances as per Institute's rules Total emoluments at the minimum of scale will be Rs 6788/- P M Qualifications Essential: (1) Candidate should have a High Second Class Master's Degree in Library Science from a recognised university or equivalent, (2) Five years' experience of working in libraries of academic research institutions/departments (3) Knowledge of documentation and reprography

Desirable (1) Candidate should have First Class Master's Degree in Library Science of a university or equivalent. (2) Working knowledge of any one modern European language other than English

Other things equal, candidates belonging to Scheduled Castes/Scheduled Tribes will be given preference. Applications indicating qualifications and experience duly supported by true copies of certificates and testimonials, should reach the Administrative Officer, National Institute of Public Finance and Policy, 18/2 Satsang Vihar Marg, Special Institutional Area (Near JNU), New Delhi 110 067 within 15 days of this advertisement

# Performance, Policy Issues and Prospects of India's Exports

O P Sharma

Against the backdrop of India's export performance in the last five years and the major policy issues thrown up by it, this paper discusses export prospects in the Ninth Plan and sketches essential contours of a policy-frame.

SINCE the beginning of planning in India, here has been a sustained improvement in export performance. However, it was with he foreign exchange crisis after the Second Plan, that an active export promotion programme was put in place with the specific objective of financing the increasing imports. Volume index of exports increased from fround 3 per cent in the 1950s to 3.5 per ent in the 1960s. Acceleration in real exports vas particularly significant from 4.6 per ent in the Fourth Plan (1969-74) t · 7 9 per ent in the Fifth Plan (1974-79). Due to nultiplicity of factors, like crop failures. energy crisis, etc. volume growth rate fell o 2.7 per cent in the Sixth Plan (1980-85). With the revival of the economy, the growth ate of volume index of export again picked up to 8 per cent in the Seventh Plan (1985-10). Encouraged by this, the Eighth Plan set he target growth of exports at 13 6 per cent per annum. As against this, the volume index has shown an increase by over 12 per cent per annum in the first three years (1992-95). Considering these trends in exports, the acceleration in the rate of growth of the ecoiomy during the last two years, and increasing outward orientation of the economy due o the process of liberalisation, it should be possible to step up the growth rate of exports in the Ninth Plan This would, however, require some major thrust in our export policy to widen the base of export activity.

This paper is divided in four sections. In Section I, we briefly analyse India's export performance during last five years ending with 1995-96. The analysis is based on statistical evidence on aggregate as well as sectoral export trends. Section II provides an analysis of major factors and policy issues in export performance In Section III, we separately analyse the issues concerning infrastructure and export efforts of various states. In this section, some fresh evidence is provided on inter-state differences in infrastructure and states' export orientation. Finally, in Section IV, we discuss very broadly the prospects of India's export during the period of the Ninth Plan and some essential contours of a policy-frame. As this outline suggests, this paper, by and large, concentrates on supply side factor which is consistent with the widely held view that international demand does not operate as a constraint on India's exports.

# Review of Export Performance in Eighth Plan

Table I provides trends in India's exports in terms of SDR, US dollar and Indian rupee. The purpose of providing the data on trade flows in various measures of value is to enrich our understanding of the trends in exports during the last five years characterised with sharp exchange rate variations and far-reaching changes in policies both in India and our export markets. The table also gives annual variations in value of exports, real exports in terms of volume index brought out by DGCI and S and India's share in world exports.

Analysis based on the data given in the Table I atend leads to following conclusions: (a) Except for 1991-92 and 1992-93, we have been able to gradually increase our share in world exports from 0.53 per cent to 0.59 per cent. However, further details, not reported in the table due to paucity of space, indicate that our performance was not comparable with that of Asia as our share in such exports declined from 3.98 per cent in 1990 to 3.26 per cent in 1994 before increasing to 3.4 per cent in 1995.

(b) Real growth in exports as indicated by the DGC1 and S volume index was overwhelmingly responsible for the growth in value of exports. Increase in DGC1 and S unit value index by 13.6 per cent per annum during 1989-95 was primarily due to depreciation in the nominal value of rupee by 12.3 per cent per annum.

(c) Sub-period averages indicate unequivocally that export performance has been better in the post-reform period, that is, since 1992-93 both in terms of quantum as well as value of exports. An interesting fact here is that in the post-reform period, notwithstanding the liberal regime, exchange rate was perhaps not the driving force in increasing exports. Relatively small nominal depreciation and in fact appreciation in real effective exchange rate was accompanied with sharp increase in volume of exports.

That the improvement in export performence has been induced by policy reforms is indicated not only by higher growth in GDP and industrial production on which evidence will be provided later, but also by increasing orientation of the economy towards exports. Thus exports as a percentage of GDP at current prices have shown an upward trend, as can be seen from Table 2.

Another major indicator of dynamism in export sector is the increasingly more tavourable composition of India's exports which is less vulnerable to the vicissitudes in quantum and unit value of exports. Thus manufacturing sector continued to dominate the Indian exports with 77 per cent share in total exports. Such exports have registered sustained acceleration in growth rates in dollar terms from 1.2 per cent in 1991-92 to over 24 per cent during April-December 1995. Within the manufacturing sector, chemicals and allied products, engineering goods, ready-made garments and handicrafts including gems and jewellery, in which India has comparative advantage, have recorded high growth rates as shown in Table 3. This does not, however, belittle the importance of agricultural exports which showed excellent performance in 1993-94. In fact, several important products such as rice, oil, seeds, cotton and marine products have registered sharp improvement in export/ output ratios.

# II Factors and Policy Issues in Export Performance

Export performance basically depends on the supply or exportable surpluses and demand in the international market. Supply or exportable surpluses in turn depend on capacity and production, domestic demand and relative domestic to international prices, the latter partly dependent on exchange rates. Similarly demand for exports depend upon purchasing power in export market, relative prices and market competitiveness vis-a-vis trade rivals.1 We first discuss the recent trends in the world economy influencing the demand for exports and thereafter trends in domestic factors affecting supply of exports such as the macro-ecnomic aggregate, trade policy and exchange rate movements.

# WORLD ECONOMY AND DEMAND CONDITIONS FOR EXPORTS

In a large majority of products, India's share in world export is very small. Thus being a marginal exporter, India faces an elastic demand with respect to relative prices tor its products, particularly manufacture exports.<sup>2</sup> There are exceptions like textiles where due to variable export restraints or other tariff/non-tariff barriers, competing rivals face discriminatory market access.<sup>3</sup> However, in most other products, demand for India's export depends on world income or volume of world trade and relative prices in the external market.<sup>4</sup>

Around 60 per cent of India's exports go to OECD countries, 11 per cent to OPEC, 4 per cent to eastern Europe and 24 per cent to developing countries. Thus the economic conditions in industrial countries significantly determine the demand for India's export. Since 1991, when with the exception of Japan and Germany, these countries faced stagnation or decline in GDP, there has been acceleration in growth rates. Thus real GDP of industrial countries accelerated from 0.8 per cent in 1991 to 3.1 per cent in 1994. Most notable was the acceleration in GDP of the US from -0.6 per cent to 4.1 per cent and the UK from -2.0 per cent to 3.8 per cent. Even more significant has been the recovery in world trade, which accelerated from 2.9 per cent in 1991 to 9.4 per cent in 1994 in terms of volume. Volume of import of industrial countries accelerated sharply from 2.1 per cent to 10.5 per cent.5 Thus the overall demand conditions for our exports were quite favourable during 1991-94, even though, as mentioned, international price movements did not help in export earnings.

At the same time, there have been cataclysmic changes in the world economy since 1991 which are likely to have a farreaching impact on India's exports. Foremost among these is the conclusion of the Uruguay Round in end-1993. In this Round significant progress was made in market liberalisation by all signatories. Thus import weighted average bound tariff rates were reduced from 6 per cent in pre-Uruguay Round situation to 3.6 per cent in the post-Uruguay Round by industrial countries and from 71.4 per cent to 32.4 per cent by India. This could add I per cent to world GDP and 12 per cent to world trade.6 Second, the World Trade Organisation was set up which would strengthen the dispute settlement mechanism. Third, new areas like Trade Related Intellectual Property Rights were integrated into the system hastening the process of globalisation of Indian industry. Perhaps the best outcome of Uruguay Round for India is the integration of textiles into the WTO framework even though it is heavily backloaded. Apart from the Uruguay Round, other major developments of interest to India have been the ongoing implementation of Internal Market in the European Union, particularly the elimination of Article 15 of the Treaty, implementation of South Asian Preferential Trading Arrangement and india's becoming a ruil Dialogue Partner of ASEAN.

# DOMESTIC MACRO-ECONOMIC TRENDS

There has been significant improvement in the Indian economy as the growth rate of GDP accelerated from 0.8 per cent in 1991-92 to an estimated 6.2 per cent in 1995-96, average annual growth rate being 5.7 per cent during the last four years. The implied elasticity of exports with respect to GDP comes to 2.1, somewhat lower than that postulated in the Eighth Plan. This as indicated earlier is also reflected in increasing export/GDP ratios.

The sustained performance of exports during the last two years, particularly during 1994-95, was partly due to acceleration in the growth rate of industrial production. The growth in manufacturing sector by 6.5 per cent in 1993-94, 8.6 per cent in 1994-95 and over 10 per cent during April-December, 1995 has been the main force behind growth of manufactured exports. An alround improvement in infrastructural industries such as electricity generation, petroleum and petroleum products, transport, steel, etc, helped in the acceleration of industrial production. Latest trends indicate that sharp improvement in manufacturing production has been on account of export oriented sectors like leather, chemicals, metal products and machinery.

### TRADE POLICY MEASURES

The Eighth Plan's objective has been to move our trade policy regime towards greater openness and transparency and with the ultimate objective of integrating the Indian economy with the rest of the world. The key objectives of the trade policy reforms during the Plan were (i) a further pruning of the negative list of imports-exports; and (ii) gradual reduction in both the level and

dispersion of tariff rates. It has been envisaged that by the end of the Eighth Plan the negative list of imports should contain only items to be banned on grounds of environment, health, safety, etc.

In accordance with these objectives, the government has initiated steps from June 1991 onwards for the dismantling of restrictive policy instruments through reform in trade, tariff and exchange rate policies. The import policy regime was revamped by shifting a significant number of items outside the purview of import licensing. Many of the quantitative restrictions on importsexports have also been withdrawn. Policy measures such as elimination of quantitative restrictions on intermediates and capital goods, freeing large majority of tariff lines covering raw materials, intermediates and capital goods from import licensing requirements and extending the facility of Special Import Licences to export/trading houses have helped in strengthening exportproduction linkages.

The Eighth Planenvisages that the average level of tariff should be brought down to about 25 per cent during the Plan period. The peak rate of tariff has already been

reduced to 50 per cent in the 1995-96 Central Budget and the average collection rate to 29 per cent by 1994-95. The country has also moved away from a dual exchange rate and the Rupee has been made fully convertible on Current Account.

The shift in trade and exchange rate policy, along with changes in fiscal policy, industrial policy and capital market reforms, seems to have initiated a process of transfer of resources from public sector to private sector, non-tradeables to tradeable goods sectors and from more capital intensive to less capital intensive industries.7 The restructuring of the economy is also resulting from infusion of external resources and technology consequent on the liberalisation of foreign investment. Under the changing policy environment, the economy's globalisation process has moved faster and the pull of domestic market has weakened considerably. Indeed, the statistical evidence for the period 1992-96 suggests that volume of exports has accelerated despite sharp decline in the divergence between unit value index of exports in terms of rupees and domestic price indices.

# EXCHANGE RATE MOVI MENTS

The variations in exchange rates and its impact on exports has been a subject of controversy and confusion, particularly in recent months. The confusion is particularly over the uncertain relation between exchange rate and exports in the short term as distinct from a theoretically sound and empirically verified and established relation in the long term. In the short term capacity of production is limited and therefore, where there is no slack capacity, depreciation in value of rupee is a windfall to the exporter which he tries to maximise by delaying remittances. In the long term, depreciation of rupee leads to increase in capacity production and consequently increase in exports.8

The stability of the rupee against the US\$ noticed since July 1993 at around 31.37 per US\$ continued by and large during 1994-95. However, the nominal effective exchange rate (NEER) of the rupee depreciated marginally in the year 1994-95 as the dollar depreciated against major currencies. But with inflation in India being much higher than in the major industrial countries, the real effective exchange rate (REER) of the rupee rose by 8.6 per cent in 1993-94 and 5.1 per cent in 1994-95 in terms of export weights of 36 countries as computed by RBI as indicated in Table 4.

It is difficult to establish a firm relation between export performance and variations in exchange rates in India during the last two years and more particularly in recent months. However, two observations may be made on the basis of experience during the last two years. First, analysis of the trends in exports indicate that acceleration in export earnings has been more due to increase in volume rather than unit values. Second, in real terms, rupee appreciated with respect to major currencies like US \$ and pound sterling (in which most transactions are quoted) since 1992-93. This implies that it was the real improvement in the domestic economy (led by agriculture in 1993-94 and manufacturing in 1994-95) and international economy rather than exchange rate which played a major role in export performance.

The persistence of the controversy over fluctuations in exchange rate in the short term prompted us to look into the matter a little deeper. A preliminary exercise suggests that rupee remained overvalued by about 7-8 per cent in 1994-95. This is seen by comparing as to how the real exchange rate appreciated vis-a-vis major individual currencies and then compare the weighted average with the overall change in the REER. On this basis, the picture would emerge as in Table 5 on the basis of 1991-92 weights and assuming that bilateral price ratios remained constant at 1994-95 level.

Since it is assumed that the relative prices remain constant, RER is directly determined by the nominal exchange rate. Thus a depreciation of 7-8 per cent in NEER was required to realise the RER of 1992-93. If the obverse trends in RER with yen is ignored, the depreciation required in NEER would be around 11 per cent. However, correction with respect to individual currencies would require varying extent of rupee depreciation as indicated in Table 5. Since most transactions are quoted in US\$ and pound sterling, the extent of depreciation required would be of the order of 12 per cent indicating an equilibrium exchange rate of Rs 35.2 per US\$.

In the last few months, there have been sharp fluctuations in the exchange rate of the rupee. The initial depreciation of rupee by about 10 per cent helped in attaining a realistic value of rupee as brought out in the analysis above. However, subsequent events have revealed that speculative activities in foreign exchange market, triggered partly by bunching of imports, have been primarily responsible for the sharp depreciation of rupee. This is confirmed by the more recent

recovery of rupee against US \$. It is quite plausible to argue that the realistic exchange rate is still at around Rs 35 to a dollar.

Since the trade policy reforms were undertaken in 1991, new initiatives have been taken in two major areas, that is, development of infrastructure and export efforts of the states. The emphasis on infrastructure is necessitated partly to draw the attention towards a chaotic situation in critical areas such as power, transport and telecommunications. More important, the need for larger and better infrastructure would be felt even more if the objective is to sustain a higher growth rate of export and GDP. We now turn to this major plank of our export efforts.

# III Infrastructure and Export Efforts of States

While there may be no direct relation between exports and hard infrastructure, the latter does affect the former through a positive

correlation between the level or growth of infrastructure and growth in GDP or industrial production. An attempt was made to verify this kind of relationship on the basis of cross-section data reported in World Development Report (WDR) 1994 published by the World Bank. The results from simple regression equations explaining growth rates of GDP and industrial production (IP) in terms of five specific infrastructure variables, i.e., paved roads, railway tracks, telecommunication lines, electricity generated and area irrigated are reported in Table 6 for a sample of Low Income Countries (LIC), as defined in WDR 1994. The results confirm the finding that the rate of growth of specific infrastructure has positive and statistically significant impact on GDP as well as industrial production.

The following major conclusions from the exercise are worth highlighting:

- (a) In terms of size of coefficients, paved roads has the maximum impact on GDP as well as IP in LIC. This is followed by telecommunication, railways and electricity.
- (b) The impact of all infrastructure variables in terms of size of coefficients is much higher in LIC on IP than GDP. In other words, infrastructure plays much more important role in industrial sector in LIC.
- (c) Contrary to general belief, the contribution of electricity to GDP increases with the level of development. Same is the case with telecommunication. This most probably reflects the higher wastage and low productivity in LIC.

Thus apart from the level of stock of infrastructure or its rate of accretion, efficient utilisation of existing services is equally important. This to a great extent depends on the quality of infrastructure. Information given in Table 7 brings out this fact more clearly.

Thus not only the availability of infrastructure per person is low in India, the quality of infrastructure is abysinally poor. The same conclusion, it appears applies to inter-state differences in export performance in India. Two indicators have been devised in recent period which consider different sets of infrastructural variables; economic, social as well as administrative. Even though the data base on exports of the states as well as the indicators of infrastructure is poor, it is worth analysing the relations between the two on the basis of available evidence. The first of the two indicators of infrastructure brought by the Centre for Monitoring the Indian Economy (CMID) takes into account eight infrastructural sectors with varying weights: Power (20 per cent), Irrigation (20 per cent), Roads (15 per cent), Railways (20 percent), Post Offices (5 percent), Education (10 per cent), Health (4 per cent) and Banking (6 per cent). The second, estimated by Krishna Anant and Roy Chaudhary and reported in Report of the Tenth Finance Commission (1994) for 1995-2000, too considers eight variables, i.e., agriculture, banking, electricity, transport, communication, education, health and civil administration. The CMIE as well as Finance Commission indices are estimated for states with reference to an all-India average and both the indices are devised keeping in view the capital good and public good character of infrastructure. The latter utilised the index for allocating 5 per cent of its award to various states.

Table 8 provides comparative view of these indices as well as indices of Per Capita Net State Domestic Product (an indicator of development) and a broad estimate of export/ SDP ratio with reference to an All India Average. It may be noted that four states, i e, Maharashtra, Tamil Nadu, West Bengal and Delhi (with export/SDP index at 985 but not reported above as indices of infrastructure are not available) accounted for as much as 83 per cent of total export by Export/Trading Houses in India. Only Maharashtra, Tamil Nadu and West Bengal exhibit the coexistence of highly developed infrastructure, fair degree of develoment and higher export orientation. There is no wonder that these three states along with Delhi account for bulk of exports. Three states, i e, Gujarat, Haryana and Punjab fair poorly even when these are highly developed in terms of three indicators. More or less same is the case with Andhra Pradesh, Karnataka and Uttar Pradesh even though the last one is still very much undeveloped in terms of PCNSDP.

Export orientation in five states (excepting UP) should therefore be given high priority as results can be achieved in a short time without much expenditure on infrastructure.

While the limited efforts by the states in export promotion has been partly due to the provisions in the Constitution in regard to foreign trade and exchange control, this has also been due to several other factors such as reluctance of the states as they fear revenue loss from export activity, inter-state trade restrictions and lack of economic and export specific infrastructure such as information about the export potential and the export markets. For instance, DGCI and S which is the premier agency to collect and collate statistical data on trade has no system of identifying the export flow from various states. Also, the environment in various states in terms of investor friendliness differed significantly. While states like Gujarat, Maharashtra, Haryana and Punjab are considered as very export friendly, others such as Bihar. Orissa, Kerala and Madhya Pradesh lag very much behind. The states which are considered more investment friendly have good infrastructural facilities, congenial industrial relations, good availability of social infrastructure and trained and productive workforce.

A inajor reason for lack of export efforts in states has been the paucity of resources. A perusal of data on actual Plan expenditure over the period 1991-92 to 1994-95 indicates that major infrastructural sectors such as transport, irrigation, flood control have not

received sufficient allocations. Thus as compared to the growth rate of 18 per cent in the Central Plan during 1991-92 and 1994-95, the average growth rate in the five economic infrastructure sectors, such as agriculture and allied products, irrigation. flood control, energy, industries and minerals was only at 7.2 per cent. In irrigation, it was 3.5 per cent, transport 3.4 per cent, energy 7.1 per cent and industry and minerals about 7 per cent. The picture of Plan allocations in various states is not very different. Again considering the five sectors mentioned above, practically all the states excepting Jammu and Kashmir and Maharashtra reported growth rate in expenditure on infrastructure lower than the growth rate of the total Plan expenditure. States such as Assam, Bihar, Gujarat, Madhya Pradesh, Manipur, Meghalaya, Nagaland, Orissa. Sikkim, Tripura and Uttar Pradesh reported very low growth rate or even negative growth rate in expenditure in the five infrastructural sectors.10

Notwithstanding, there is a need for a comprehensive survey of the infrastructure bottlenecks in the export growth areas of each state and then work out the *inter se* priorities based on the criterion of incremental industrial and agricultural production and exports. The basic issue is how we can expand private participation in infrastructure development so as to improve efficiency and reduce demand on public finances.

# IV Exports in the Ninth Plan: Concluding Remarks

In view of rapid changes in the domestic as well as world economy, large degree of uncertainty in the behaviour of economic agents, large number of export determinants, export projection even for the medium term is quite a hazardous exercise. Few things, however, indicate clearly that the improvement in export performance in last few years can be sustained if policy reforms are continued with a view to de-bottleneck the constraint on exports.

The Eighth Plan projections indicated that exports would increase by 13.6 per cent per annum. It is quite feasible to achieve this target if exports continue to grow at the current rate in 1995-96 and grow by another 14 per cent in real terms in 1996-97. In the period of the Ninth Plan, much would depend upon the growth performance of the economy. Given the trends in 1994-95 and 1995-96, it is quite feasible to achieve a GDP growth of 6 per cent per annum based on rate of growth of 10 per cent for the industrial sector and around 4 per cent for the agriculture sector. An optimistic rate could be around 8 per cent. The acceleration in GDP is going to increase the level of exports.

Another major factor would be the increasing outward orientation of the economy as has been witnessed in last two or three years when export to GDP ratio increased sharply from around 7 per cent to over 9 per cent. Looking at the experience of the economies in Asia, it is safe to assume that export/GDP ratio would rise continuously in a gradual manner during the Ninth Plan, say from around 12 per cent in 1996-97 to 16 per cent in 2001-02. Considering at constant 1996-97 dollars (asssuming inflation rate at 8 per cent in 1995-96 and 6.7 per cent in 1996-97 and exchange rate of Rs 35/\$), the four scenarios of export could be as given in Table 9.

The feasibility of the scenarios would, as indicated above, depend upon the performance of the economy and its increasing outward orientation. Several policy steps may be required if the targets set are more ambitious in terms of the performance of the economy. Considering the discussion above, these could include the following:

(a) The active involvement of state governments in export promotion is of crucial importance for dissemination of information on trade policy changes, export opportunities, etc, to the industrial and trading community

at large. In fact there should be a three-tier institutional set up for export development/ promotional activities; (i) Ministry of Commerce and Central/National Level Export Promotion Organisations; (ii) State Level Export Promotion Department and Export Promotion Organisationss; (iii) Field Level Organisations/Industries. There should be a closer inter-action between the above organisational wings in respect of export promotion activities. Some of the state governments have already set up a separate department for export promotion which has to be followed by all the state governments/ UTs.

(b) General development of infrastructural facilities in the country in the form of road and rail network, ports, shipping and air services, availability of power, reliable telecommunication network, etc, are of paramount importance for export production and export marketing. All major seaports and airports have to be linked through proper road and rail network. There should also be provision for warehousing and storage facilities at production centres as well as seaports/airports. There have been frequent complaints of non-availability of adequate air cargo space and shipping services. Besides, refrigerated container services are

Alt II = 8 per cent.

Alt II = 8 per cent. Alt III = 8 per cent.

Alt IV = Export increase by 20 per cent per annum

Sources: 1995-96 estimates are projected on the basis of data up to November given in DGCI and S-Monthly Statistics. It is assumed that GDP will grow by 6 per cent in 1996-97.

highly inadequate to handle the movement of highly perishable items like food products, horticultural and floricultural products.

- (c) For penetrating new markets and sustaining the level of exports, greater attention has to be paid to the aspects of grading quality control, packaging, etc. as per the specifications/requirements of the importing countries. Quality upgradation and certification is of utmost importance in the develoment of exports. Some success has already been achieved in this direction by certain industries. This has to be extended to all commodities meant for export production. Besides, scientifically designed, efficient and low cost packaging has to be evolved for different categories of products to meet international standards/specifications. Packaging aspects have been a long neglected area in this country and we have to pay immediate attention to this aspect for development of exports.
- (d) Awareness of various Indian products in terms of quality, variety, price, etc. have to be created in the international markets through greater participation and involvement in trade fairs and exhibitions held abroad from time to time. Besides, promotion of Indian brand names and publicity through departmental stores in the foreign markets is important for increasing our exports. The exchange of trade delegations and development of close interaction between the business/trading community in India and in various other countries will also go a long way in promoting our exports.
- (e) Besides retaining the existing product mix and markets abroad, we should explore the possibilities of penetration of new markets and introduction of new products to meet the emerging demands abroad in tune with the changing lifestyles technology, tastes and preferences. For instance, countries in Africa and Latin America have been a neglected area and the volume of trade between India and these countries has been very low. We should undertake detailed market surveys in these countries and pay greater attention to product development to meet the requirements.
- (f) Agricultural and allied sector (animal husbandry, fisheries, poultry, etc) offer tremendous potentials and prospects for export development. In fact major thrust areas for export development have to be identified and greater attention has to be paid for development of exports. Some such commodities having very high potential for exports are horticultural and floricultural products, processed foods, marine products and meat preparations. Export-oriented production is relatively a new concept in the agro-based sector. It would be desirable to evolve an integrated approach to exports, i.e., from the farm-yard to dock-yard linking

the various stages like (i) production; (ii) processing; (iii) quality control; (iv) packaging; (v) storage; (vi) transport; and (vii) export. Aappropriate institutions have to be developed for this purpose and linkages established between them for an integrated export-oriented production in the agro-based sector.

- (g) There exists great potential for the export of various services in which the advanced/developed countries dominate at present. The areas having high potential for exports are; (i) electronic and computer software; (ii) technical and engineering consultancy service; (iii) banking and insurance; (iv) shipping and air services; (v) tourism and notels. In fact the potential and growth in the export of services is closely linked to the growth of merchandise exports. India has a very strong industrial base and a large highly skilled manpower in a wideranging scientific/technical and commercial activities. There exist tremendous potential for the export of different forms of services which has to be tapped.
- (h) Many of the developing countries in Asia, Africa and Latin America offer tremendous scope for the setting up of joint ventures and turnkey projects for the development of basic infrastructural facilities and industries. Some of these areas of opportunity are (i) development of transport network in the form of roads, railways, bridges, sea-ports, airports, etc; (ii) operation and maintenance of transport network in different forms; (iii) setting up of power plants; (iv) setting up of chemical and petrochemical projects; (v) setting up of cement, paper and coal-based industries; (vi) setting up of industries in the mining and metallurgical sectors.

# Notes

- 1 For a rigorous analysis of 'export competitiveness', see O P Sharma, 'Export Competitiveness: Some Conceptual Issues', Foreign Trade Review, Vol XXVII, No 2, July-September 1992.
- 2 This is supported by empirical evidence in recent period See, for instance, Arvind Virinani, 'Demand-Supply Factors in India's Trade', Economic and Political Weekly, February 9, 1991
- 3 Even in textiles and garments facing quota restraints, price enters as a significant determinant of demand for Indian products. For formal econometric evidence, see O P Sharma, 'Competitiveness of Indian Textiles in the EEC: 1974-85', PhD Thesis submitted to JNU (New Delhi, 1991) Also see his. 'Quota Restraints and MFA II: Some Empirical Evidence on India's Exports to the EEC', Economic and Political Weekly, September 29, 1984
- 4 Apart from the revival of industrial economies, elimination of trade barriers in intraregional trade in some of the areas has benefited developing countries such as India.

- See O P Sharma, 'Europe 1992: Implications for India's Exports', Foreign Trade Review, Vol 26, Nos 1 and 2, April-September 1991.
- 5 Fordetails, see IMF, World Economic Outlook, October 1995.
- 6 See IMF, International Trade Policies, The Uruguay Round and Beyond, Vol 1, Principal Issues, (Washington 1994), ch 3.
- 7 For a comprehensive assessment of the Indian Economic Reforms Programme, see Ajar Chopra and others, India: Economic Reforms and Growth, IMF, Washington, December 1995).
- 8 No doubt, even in the long term, the impact of real economy on exports is overriding. Testing on the data pertaining to volume of exports (XT), GDP and exchange rate (ER), the following two OLS log-log regression equations confirm the propositon:

XT = 8 18 - 0.7676ERT - 0.0380T(-8.135) (-0.666)

R-Bar-Sqr 0.9256 (t values) Sample: 1978-95

XT = -3.83 + 1.86GDPT - 0.1817T(6.761) (-2.091)

R-Bar-Sqr 0.9001 (t values) Sample: 1978-95

Nevertheless, taken individually, both ERT and GDPT are strong enough to even subsume the impact of the remainder expressed in terms of time.

- 9 This conclusion needs to be taken with caution as the exports from the major ports may as well be from neighbouring states DGCI and S or FIEO do not provide separate data to verify this.
- 10 For details, see Government of India, Planning Commission, Annual Plan 1995-96, Ch 2

# Fascism, Socialism and the Left

# Paresh Chattopadhyay

While Aijaz Ahmad (EPW, June 1) gives a brilliant blow-by-blow account of the high parliamentary drama preceding the United Front's accession to power in the context of the rise of the communal variant of fascism in India and its striving towards gaining a parliamentary majority, he has dealt unevenly with three issues: consensus and nationalism; fascism; and bolshevism, commune and socialism. This paper focuses on these issues.

WE read with considerable interest Aijaz Ahmad's fascinating piece 'In the Eye of the Storm' (EPW, June 1). He gives a brilliant blow-by-blow account of the high parliamentary drama preceding the United Front's accession to power in the broad context of the rise of the communal variant of fascism in India and its striving towards gaining parliamentary majority. We would like to share with Ahmad and other readers of the EPW some reflections that arose from our reading of his paper. Unfortunately, never quite understanding India's electoral politics - in a sense Ahmad's main concern - we have to set it aside. We would, instead, deal with issues which at first sight might appear as incidental (to Ahmad's main theme), which of course they are in a certain sense. But here we are using the term 'incidental' in a somewhat different sense - as in 'incidental music' in the European tradition, where incidental music becomes as important as the play itself which it accompanies (like, for example, Mendelssohn's music for Shakespeare's A Midsummer Night's Dream or Gricg's music for Ibsen's Peer Gynt). In what follows we shall focus on three issues unevenly dealt with in the paper under consideration. consensus and nationalism; fascism; bolshevism, commune, socialism.1

# Consensus, Nationalism, Patriotism

The author refers to a 'consensus' among the bourgeoisie on liberalisation, as seen in the agreement between the "two major parties of this class" (p 1330). However, it seems that the 'Left' is not completely outside of this 'consensus', as he himself asserts, referring to the CPI(M)-led West Bengal government, that "industrial policy is not as sharply differentiated from that of the centre as it should be", adding, of course, the usual CPI(M) argument that the states cannot "go against the grain of the centre in a basic way" (p 1339). How about the other no less important domains of the country's life?

Indeed, in its extraordinary zeal for nationalism, nay, patriotism, CPI(M) – like most of the 'Left' – has been at least equal to the bourgeoisie, and, to paraphrase Ahmad's words, "entirely agrees with the two major parties of this class", though

under the ideological cover (Marx's 'false consciousness') of (till-defined) 'antiimperialism'. This involves the preservation of 'national unity' and 'sovereignty', with the practical (immediate) consequence of supporting the entire oppressive bureaucratic - police-military state apparatus including the nuclear and non-nuclear arms policies of the 'bourgeois-landlord government'.3 This 'consensus' also includes the CPI(M)'s supporting to the hilt the 'bourgeois-landlord' government's armed suppression of the right to self-determination of the oppressed minority nationalities in the north-west and the north-east of the country. It is with immense courage and at great risk that the human rights groups and a handful of individuals are upholding the democratic rights of these oppressed peoples. The CPI(M)'s position is unambiguous: "The Party has remained in the forefront of the struggle against separatist movements to defend the unny of the country, [and] the struggle to defend national unity must be carried forward". Similarly the party condemns "the anti-social activities of the extremists who molest women and extort money" while conceding that the security forces (only) "often" commit excesses, but, then, these forces are "deployed to combat terrorist violence" (Political Resolution of the 15th Party Congress, April 3-8, 1995, Chandigarh, p 37). During his recent visit to London, the CPI(M) leader Surject, referring to the human rights critics on Kashmir, held, like any 'bourgeois-landlord' patriot, that the Indian security forces are "faced with terrorism and a proxy war .. They are dealing with forces who have no mercy for anybody. In such a situation to say in the name of Gandhi that 'I stand for peace, attack me, kill me' - that becomes a little impossible. Human rights critics do not know in what difficult situation the armed forces are fighting these men" (India Abroad August 2, 1996, p 10). Six years ago the same leader had written that "the separatists and extremists in Jammu and Kashmir who are out to destabilise the country .. must be told that the people of Kashmir have linked their fate with the people of India and that the accession is irreversible". Citing - more than approvingly - the consultative committee attached to the external affairs ministry of the 'bourgeois-landlord government' that "Jammu and Kashmir is an integral part of India and that any interference or any claim whatsoever in the internal affairs of India would not be tolerated", the 'communist' leader emphasised that this "clearly expresses the will of the Indian people (inasmuch as) all the political parties are represented in this committee" (Save Kashmir. To Defend Secularism and National Unity, New Delhi, 1990, p.17). What else is this but a 'consensus' with the 'bourgeois-landlord' rulers "to the last comma and dot and smudge of ink", in Ahmad's parlance (p. 1330)?"

As if this blatant, rabid chauvinism were not enough for the 'Left'! For Ahmad the' 'Left' is still not sufficiently nationalist, compared to 'right-wing nationalism', that is. According to him "an ideological cement of nationalist kind is an objective necessity" for the 'Left', inasmuch as "if Left fails to provide that cement, and if ideological tradition descended from the anti-colonial movement begin to collapse, an aggressive kind of right-wing nationalism will step into that vacuum..." (p. 1337; emphasis in original). This nationalist ideology 'descended from the anti-colonial movement' is of course the ideology of the 'bourgeoislandlord classes' having sub-imperialist ambitions Even before independence. Nehru, the secular, democratic idol of much of the 'Left' had written that an independent India would not only be the centre of political and economic activity in the region of the Indian Ocean, the South-East Asia and the west Asia but also exert great influence in the Pacific Ocean, even though it had no geographical relation with the latter [Nehru 1945] As an illustration of this big power ambition we would mention just one case. The India-Nepal Treaty of Peace and Friendship of 1950 contained a secret 'mutual assistance' agreement providing for appropriate arrangements to deal with "any threat to two governments". Nehru revealed this to the Lok Sabha about a decade later. As Nehru told the Lok Sabha in 1959, 'Where the question of India's security is concerned, we consider the Himalayan Mountains as our border" (in Mihaly 1965). The saffron fundamentalists are very much an offshoot of this 'anti-colonial' nationalism - an 'optimum mix' of pre-bourgeois and bourgeois ideologies. Far from signalling a "most radical rupture with the traditional ideas", as the Communist Manifesto thought the communists would make. Ahmad's prescription would amount to the communists' abject surrender to the enslaving ideas of the 'old world'. It is remarkable that the 'Left' - particularly the 'Marxist-Leninists' of the CPI(M) type - never fought India's 'bourgeois-landlord' world outlook. soaked in religion, by a systematic and thoroughgoing materialist world outlook. by a frontal attack on religion itself (including its 'secular version' a la Vivekananda) armed with materialism. That might not help the 'Left' in elections, but that would surely gather around them the most oppressed sections in society - the majority - precisely the victims of religious mystification perpetrated by the ruling classes. (Indian philosophy remains to be liberated from religion.)

# II Fascism

### (a) Counter Examples

Regarding 'fascist takeovers' Ahmad lays down "two pre-conditions: a fully fledged crisis of the constituted state, and an insurgent working class aspiring to seize power". Here the author speaks in terms of 'universal affirmative' (in the language of Aristotelian logic), the said 'pre-conditions' being asserted as valid for "the entire history of fascism" (p 1338). In the absence of any precision on his part we do not know which regimes would qualify as 'fascist'. However, given his examples - Italy, Germany, Iran and (possibly) Chile - the term seems to have a wide range, englobing advanced capitalism, backward capitalism and even semi-feudalism. Are the said 'two preconditions' valid for each and every 'fascist takeover', taking a broad meaning of fascism within a wide range, as suggested by Ahmad's examples': Let us take one or two (counter) examples.

# Portugal

In the case of Porgtuguese fascism there were intermittent battles between the republicans and the royalists in the twenties, where the working class, a tiny fraction of the total working population in this very backward capitalist country, did not show any sign of 'insurgency' (literally, rising in active revolt), far less any indication that it was 'aspiring to seize power'. The fascist dictator – a soft-spoken university professor of economics – had no dramatic entrance on the scene like Mussolini, Hitler (or Khomeini, the 'clerical fascist'). He started as a minister of finance in 1928, being called to this position by the military ruler, restored the

country's finances without much fanfare, then, backed by the middle classes for his success in putting the chaotic Portuguese economy in order and assuring himself the support of the army (gradually organising the 'green shirts' in the process), consolidated his position rather slowly and remained the absolute master of the Estado novo—created by a plebiscite in 1933 where the poor and the unlettered had no right to vote.

# Japan

In the case of fascism in Japan, we, again, have an example where it would be difficult to validate the 'two pre-conditions'. Here, once more, there is no evidence of an 'insurgent working class aspiring to seize power'. As regards a 'full-fledged crisis of the constituted state' - this sweeping assertion is also of doubtful validity. An eminent historian has written: "Japanese fascism differed from the German form and even Mussolini's Italy...There was no sudden seizure of power, no outright break with previous constitutional democracy, no equivalent of a March on Rome...Fascism emerged much more 'naturally' in Japan; that is, it found congenial elements in Japanese institutions even more than it did in Germany. Japan had no plebeian Fuhrer or Duce. Instead the emperor served as a national symbol in much the same way" [Moore 1966].6

Iran

Let us take Iran. Ahmad writes: "In Iran clerical fascists rode to power only after mastering the largest working class uprising in the Middle East and in the midst of a crisis of the state" (p. 1338). Of the two (pre)conditions of the victory of fascism given here, while the second is true, the first is grossly exaggerated as regards the working class. The statement also passes over an unsavoury tale about the role of the so-called working class leadership in Iran in the victory of clerical fascism, to which we shall return in a moment.

There was no 'working class uprising' in Iran on the eve of the Islamic takeover in February 1979 (where 'working class' is used in the Marxian sense of industrial proletariat). There was an uprising of the non-working class masses, the overwhelmingly immense majority of the Iranian society. The popular movement, gaining increasing momentum, showed itself particularly in massive demonstrations beginning in January 1978, and at 40-day intervals, specially in Qum, Tabriz and Teheran, of which the Tabriz demonstrations of February 18-19, 1978, with more than 40,000, were the most important as they set the pattern of violent demonstrations to be

seen in early autumn (1978) when the Grand Ayatollah of Qum emerged as the only appropriate spokesperson of the country. These were all religious demonstrations. Four distinct groups participated in the mass movement: (1) the mullahs who directed and organised the movement; (2) the 'bazaar', that is, the merchants, retailers and artisans, the traditional sector of the urban economy; (3) the mass of the 'disinherited' inhabiting the shanty towns and slums around the cities - the 'lumpen proletariat' - created by rapid urbanisation and rural exodus who took Khomeini as the saviour ('mahdi'); (4) the youth unable to enter universities (in 1977, out of about 300,000 applicants only 60,000 had been accepted), awaiting conscription, joined by the mass of unemployed high school graduates of the earlier years. The latter group along with the 'lumpen proletariat' provided a massive reservoir of discontent set loose by the Islamic agitators. The industrial workers - the working class properly speaking - only later joined the upsurge through strikes in any significant way, constituting in no way a 'working class uprising'. What about the supposed -'leadership' of the working class in Iran during this period? We would ordinarily expect the communist party to be in the forefront of the struggle against fascism. During the first few months after the fascist takeover when the new regime was trying to consolidate its victory and still allowing different anti-Shah political parties to function, the self-appointed working class leadership, the Tudeh party, uncritically following Russia's 'anti-imperialist' policy of backing the new regime, allied itself with 'clerical fascism'. "The Tudeh party", writes a keen Iranian observer, "outdoing all others in servility, patiently continued to receive insults according to the degree of their opportunistic miscalculation, their thirst for humiliation, or the magnitude of their dashed hopes" [Arani 1979]. This was indeed a sad spectacle of "abject surrender to the Islamic party". After having consolidated power the regime, naturally, clamped down heavily on the parties, hitherto its unconditional supporters, and Khomeini, backed by the immense majority of the country including the 'working class', declared in August 1979 that, after having allowed the opposition six months to show their true faces, his party would now "break their poisonous pens and crush their conspiracies". This brings us to the extremely uncomfortable question: how did the communist parties situate themselves in the face of the ascendance and victory of fascism? In no way generalising, below we deal with two classic cases of fascism - one mentioned, the other unmentioned in Ahmad's paper - Germany and Spain, the degree of sordidness of the party's role increasing in that order. We shall analyse

the Spanish case at some length, compared to the German, in order to emphasise, at the same time, that what was happening in Spain 60 years ago was not simply a war between the 'republic' and 'fascism' but the beginning of a profound social revolution — a fact carefully suppressed by the dominant propagandists ('communist' as well as bourgeois) outside Spain. We hope readers will bear with us.

(b) Communist Party and Fascism: Germany, Spain

# **Germany**

The victory of fascism in Germany occurred in a period which was qualified by the Russian and the Comintern leadership(s) as the 'third period of the general crisis of capitalism', a new epoch of class struggles and civil wars favourable for the proletarian revolution. The Sixth Congress of the Comintern (1928) laid down the tasks of the communists corresponding to this new situation, epitomised in the 'class against class' formula. It affirmed the gradually "maturing revolutionary situation", the social democrats being qualified as the "principal enemy" of the working class [Borkenau 1962; Claudin 1970; Kriegel 1983]. In 1929 the tenth plenum of the Central Executive Committee of the Comintern, qualifying social democracy as "social fascism", declared that "the aims of the fascists and those of the social democrats are identical".8 On August 9, 1931, the German community party (KPD) voted together with the Nazis against the social democratic government of Prussia in a referendum and the fall of this government was hailed by Pravda on August 13 as a victory of the working class. All the actions undertaken by the Nazis against the social democratic trade unions one year before Hitler's accession to power were supported by the KPD whose general secretary, Thaclmann, spoke of "a single class front with the Nazi proletarians" [Buber-Neumann 19711.

Shortly before Hitler came to power, the KPD declared that social democracy with its view that fascism demanded a single block of the working class with the democratic fraction of the bourgeoisie constituted the principal obstacle to the passage of the working class to a revolutionary position. Even two days after Hitler became chancellor, Thaelmann wrote that the recent events signifed "a turning point in favour of the proletarian revolution", and three months later the party still declared that "the proletariat has not lost any battle, has not suffered any defeat" [Buber-Neumann 1971; Kriegel 1983]. It was only in 1935 that the Comintern fully realised its folly, but then it was too late. Any working class resistance to Hitler from within Germany - indeed any internal mass resistance - had become only an academic possibility."

Spain

In Spain, as elsewhere, the communist party (PCE) was following a most sectarian line of 'class against class' during this 'third period of the general crisis of capitalism'. After the Second Republic was established in 1931 (the first was in 1873), the party's slogan was "down with the republic" and "all power to the soviets" when none existed in Spain. As elsewhere, they qualified till 1934, the mass socialist party of Spain (PSOE) as "social fascists" and the anarchosyndicalists CNT (or CNT-AFI),10 who had profound roots in the Spanish producing classes and an immense mass following, as "anarcho-fascists". The Second Republic had opened the way for the basic demands of the working people, which the country's rulers were incapable of satisfying, around the problems of the agrarian reform, nationalities, the relation between the church and the state, the entire monarchist apparatus of bureaucracy and the army. It was really the democratic revolution that was on the agenda which only the producing classes could undertake, and their victory would pave the way for the success of the immediately following proletarian revolution. The PCE's sectarian stand of 'class against class' denouncing everybody else on the left as 'social-fascist' showed their incapacity to understand the need of maximum mobilisation of the working people for the success of the democratic revolution. A U-turn came with the Comintern's completely opposite 'line' of the 'united front', leading to a movement to organise a 'popular front' in Spain.

After two 'black years' of reaction (bienio negro) 1933-35 - the period of the rightists' rule - the recently formed Popular Front (FP) came out victorious in the general elections of February 1936, with a slim majority though It consisted of the entire non-anarchist anti-fascist forces of Spain including the PCE and the dissident (anti-Stalin) communists.11 Leaving aside the traditional anarchist policy of abstention from parliamentary elections (no votad), which had contributed to the victory of the right in 1933, the CNT, without being a part of the FP, participated in the elections voting for the Front and thus contributing to its victory. From the announcement of FP's victory the labouring people on their own organised gigantic victory parades, opened the prisons, and clashed with the police who wanted to check peoples' initiative. All over Spain strikes broke out for immediate rehiring of the workers who had been laid off, the retrospective payment of wages to the jailed workers, against labour discipline, for a rise in wages and new conditions of work. In the countryside the poor peasants' seizure of land (asentamientos) multiplied, leading to armed clashes with the civil guards. The peasants stopped paying rents, in Andalusia farm workers occupied the fields, railway workers stopped working, demanding nationalisation of railways, the Catalans reestablished the integrity of their status of autonomy.

While the reaction of the anarchosyndicalists and the left socialists to this spontaneous and tumultuous rise of the worker-peasant movement was one of enthusiasm, the opposite was the case with the PCE, switching now from the left sectarianism of the 'class against class' phase to a position of right opportunism under the cover of the 'united front' tactic. In a discourse at Saragossa the secretary of the party, J Diaz, declared "Today we are in a period where the bosses provoke and stir up the strikes for the political reasons of sabotage and where the fascist elements enter some organisations as agents provocateurs to serve the ends of reaction" [in Broue and Temme 1961]. This position was very close to that of the right wing of the socialist party led by Prieto. A Nin, the leader of POUM wrote, on the contrary, "For the democratic bourgeoisie the revolution has ended. For the working class, it is one of the stages of its development. For the first, every action in the way of impelling the revolutionary process must be suppressed resolutely. For the second, to accelerate this process, to imprint a vigorous rhythm constitutes an unavoidable duty. ... Each retreat of the reaction, each progress of the revolution has resulted directly from the initiative, from the extra-legal action of the proletariat" [Nin 1971]. On June 1, 1936, the construction workers of Madrid went on strike demanding higher wages, a 36-hour week, a month's paid holiday annually and recognition of professional illness. After some time, when the bosses would not give in and the workers were starving, the CNT called upon the workers to get their food form stores and serve themselves in the restaurants without payment. The communist paper Mundo Obrero denounced the call as "anarchist provocation".

When the fascist uprising finally took place on July 17 (1936), the republican government which contained right wing socialists initially refused to recognise the gravity of the situation and the next day declared that "a vast anti-republican movement has been nipped in the bud". (As a matter of fact the secretary of the CNT had warned two days before the general election that the "rightists are ready to provoke a military action" and that "Morocco seems to be the centre of the conspiracy.") The

councit or immisters retused again the demand of the left socialists advanced in the name of their trade unions, UGT - first made five days before the uprising - to distribute arms to the workers. Far from demanding arming the workers the PCE, continuing to play the parliamentary game, declared in a joint statement with the socialists that the "government has sufficient means at its disposal" and that "the government commands, the Popular Front obeys". On its side the CNT (supported by the UGT) called for a "revolutionary general strike" and asked its committees and militants to bring their arms to the local offices of the organisation [Broue and Temime 1961]. As a matter of fact - much to the surprise of the fascists who counted on a quick victory within three days after the uprising, people's spontaneous resistance, independently of the parties and in the face of the republican government's refusal to distribute arms, succeeded in defeating the fascist rebellion in two-thirds of the country - including Valencia, Barcelona, Madrid and Asturias, The legend of the invincibility of the army was destroyed and the fascists were faced not with a weak, hesitant republican government of the Popular Front, but with a whole people in arms. On the agenda since 1931, the Spanish revolution exploded as a spontaneous reaction to the fascist uprising. As in Paris 65 years earlier, the counter-revolution in Spain imposed revolution on the producing classes before they were fully prepared for it.

There appeared, gradually, people's new organs of power with real authority, the innumerable 'committees' (consejos, comites, juntus) at local, regional and provincial levels - the real governments in which the new power resided. This revolution, spontaneous in character like all genuine people's revolutions, was naturally multifaced in which superficial and hostile observers saw only 'anarchy' or 'disaster' without comprehending its profound significance: the working people taking charge of their own defence and, thereby, their own social existence, without any 'guide'. Trotsky, one of the architects of the Bolshevik seizure of power - second only to Lenin - closely watching the events in Spain pertinently observed that the Spainsh proletariat "showed itself, from the first day of the revolution, not interior but superior to the Russian proletariat at the beginning of 1917". Historians have remarked that one of the signs of the depth of the revolution was the massive participation of women, on a level of perfect equality with men. everywhere, in the committees as well as in the armed militias. In the days following the fascist uprising, the committees -- where workers' organisations were represented in proportion to their numerical strength-seized

an iocai poweis, tagated in then regions not only the immediate problems like maintaining order and controlling the prices of essential commodities, but also the question of socialisation or syndicalisation of industrial enterprises, expropriation of the church property and the property of the big landlords, the distribution of land among the sharecroppers or its collective exploitation, confiscation of bank accounts, municipalisation of housing, organisation of schools, of social assistance. These 'committees' were not much to the liking of the PCE whose leader J Hernandez would later write: "The committee was a kind of troubling, dark power without specific functions which, as a veritable government, exercised a merciless dictatorship." As a matter of fact, in Catalonia the PCE conjointly with the socialists even tried to persuade unsuccessfully though - the president of the 'Generalitat' (Generalidad, Catalonia's autonomous government) to form the 'Militias of the Generalitat' which they wanted to be pitted against the anarchosyndicalist - POUM militias [Benavides 1944]. "The essential point of the militiasystem was social equality between officers and men. Everyone from general to private drew the same pay, ate the same food, wore the same clothes, and mingled on terms of complete equality. Each militia was a democracy and not a hierarchy. It was understood that orders had to be obeyed, but it was also understood that when you gave an order you gave it as comrade to comrade and not as superior to inferior. There were officers and NCOs, but there was no military rank in the ordinary sense, no titles, no badges, no heel-clicking and saluting" 10rwell 19661.17

The foundations of the old society were immediately attacked by the producing classes in arms. The economic basis of the church was destroyed in a few days. The same fate befell bourgeois private (individual) property. To the workers the big landlords, the church and the bourgeoisie were the allies of the fascist generals. The objective of the working people was clear: land to the peasants, factories to the workers. To achieve this objective varieties of solutions were adopted by the working people. As regards industry, there were two types of measures - simple seizure of enterprises (incautacion), the general rule in Catalonia, or a control jointly undertaken by the worker: 'delegates and the representatives of the government (intervencion), mostly outside Catalonia. More than anywhere else Barcelona symbolised the new revolutionary situation - called by Borkenau the "Bastion of the soviet Spain" (1937) - 'soviet' in the original revolutionary sense of the term before its deformation, that is. Here the armed workers were in power (as they were in care of acare carrier). From the little days of the revolution they took charge of the public transport (trains, buses, metro), the railways (soon to be administered over the whole zone by a CNT-UGT committee), gas and electricity, telephone, press, cinema, theatre, hotels and restaurants, and then most often big industrial and transport enterprises (mostly foreign capital). Only two days after the fascist uprising, public transport began to function normally, as did gas and electricity, and, after a few days, railway services were also fully restored. In the countryside there took place a vast movement of collectivisation which was of course not always - and could not be in the situation - voluntary. However, in the beginning of September 1936, a peasant conference in Barcelona under the auspices of the CNT called on its militants to respect the small peasant private property and try persuasion and not force to convince the small peasant proprietors into joining the movement. On the whole, the collectivisation movement englobed about three-quarters of the land organised in communities mostly with CNT affiliation. An extraordinarily sharp observer of the Spanish scene opened his magisterial. work with the following remarks: "Although the outbreak of the Spanish civil war was followed by a far-reaching social revolution in the Anti-Franco camp - more profound in some respects than the Bolshevik Revolution in its early stages - millions of discerning people outside Spain were kept in ignorance not only of its depth and range, but even of its existence, by virtue of a policy of duplicity and dissimulation of which there is no parallel in history" [Bolloten 1991].13 On the Left the PCE was the most resolute opponent of this collectivisation 'from below' just as it was opposed to the worker's armed militias controlled by the workers themselves. Jose Diaz, the communist leader, observed that such measures were "absurd and amount to being an accomplice of the enemy", and denounced "the three enemies of the people: fascism, Trotskyism and the uncontrollables" [Claudin 1970].

In fact, on the Left, on the whole question of workers' spontaneous revolutionary initiative in the formation of the armed militias as well as in the measures undertaken to collectivise - 'from below' - landlord and bourgeois property, two diametrically opposed points of view clashed. The leaderships of the right wing socialists and communists warned against "revolutionary extremism" and held that the movement was not for a (social) revolution but for a democratic and parliamentary republic "with an extended social control", for the "defence of the republican order, respecting property". The point of view was also aimed at reassuring the bourgeois democratic governments of London and Paris in the hope that they would materially help the republic in its war against fascism. (This hope of course was completely belied.) "First win the war, revolution will come later". The opposite point of view - shared by the workers in arms - held that the war was being fought for the victory of the revolution and the revolution was being made to win the war. As the left socialist Claridad put it at the end of August 1936, "This war and the revolution are the same thing...the people are not fighting for the Spain of 16 July...but for a Spain from which its roots would be extirpated. It is the revolution in the rear that assures and inspires the victory in the field of battle". This point of view was shared by the POUM.

However, the 'dual-power' situation - the power of the self-constituted workers' 'committees' and their armed militias on the one hand, and the power of the republican government on the other - soon ended, which at the same time saw the triumph of the first point of view over the second. A Popular Front government was formed on September 4, 1936, consisting of bourgeois republicans, the socialists, the communists, the UGT Aid began to arrive from Russia, the only capitalist country (besides Mexico) which, to its credit, decided to intervene materially on the republican side, its arms supplies being paid with 500 tons of gold from the Spanish Central Bank The arms aid was accompanied by some two thousand nulitary, political and secret service personnel from Russia. The Russian intervention gave the PCE a position it could never otherwise have obtained. The Russian arms were supplied mainly via the PCE who of course saw to it that as few of those arms as possible got to their political opponents, which explains why there were so few arms on the fronts (like Aragon) where the fighters were mainly the anarcho-syndicalists and 'dissident' communists. The gratitude to Russia for the arms and the arrival of the International Brigades<sup>14</sup> immensely raised the communist prestige. A contributing factor undoubtedly was the heroic and crucial role played by thousands of Spanish communists independently of their leadership - in the anti-fascist resistance, winning victories against great odds. At the same time, by proclaiming a non-revolutionary policy, the PCE was able to gather all those whom the 'extremists' had scared. There was an enormous growth of party membership, the influx mainly coming from the middle classes - well-to-do orange growers of Valencia, peasants (scared well-to-do collectivisation) from Catalonia, small shopkeepers and businessmen, army officers, government officials - but not the manual workers who remained firmly fixed in their anarcho-syndicalist unions. A British historian, observing the scene closely, wrote: "One had a strange and novel situation – on the one side stood the huge compact proletariat of Barcelona with its long revolutionary tradition, and on the other the white-collar workers and petite bourgeoisie of the city, organised and armed by the communist party against it" [Brenan 1969].

In this situation of increasing strength of the PCE, backed by the Russian arms aid, and gradually accepting the PC and right socialist position of separating war from revolution, the CNT leadership, without consulting the CNT general membership and seriously compromising CNT's longheld anti-state principle, joined the republican government, and, in Catalonia, agreed to collaborate with the 'Generalidad' and dissolve the Central Committee of the Anti-Fascist Militias, which had been the real workers' power in Catalonia. The Catalonian government dissolved the workers' 'committees' and replaced them by municipalities. Simultaneously there began a steady move towards militarisation of the workers' militias by turning them into a regular army. While everybody on the republican side agreed on the need of greater discipline and co-ordination towards a coherent strategy in the ranks of the fighters, there were wide divergences on how to attain this goal. The anarcho-syndicalists wanted these transformations within the framework of worker's militia, maintaining the system of electing officers, equality of pay and no gazetted rank. The PCE and its allies, under the supervision of the Comintern's 'delegates' or 'instructors' (like Codovila, Stefanov, Togliatti under their various aliases), wanted a fully militarised hierarchically organised regular army - of course under the appellation of Peoples' Army - under a unitied single command (mando unico). The second position triumphed, though with strong initial opposition, particularly by the anarchist youth with their slogan: "Down with the army, Long Live Peoples' Militias" (Abajo el ejercito, vivan las milicias populares!). A decree on 'militarising the militias' was passed by the republican government. The very important Russian aid in arms, which PCE withheld supplying to the militias who refused to be militarised, largely contributed to the defeat of the revolutionary line of the workers' militias

A turning point came on May 3, 1937 when, following upon government order to surrender all private arms and in the circumstances that have always remained somewhat obscure, the Catalonian head of the police, a communist. brought in, reportedly on his own initiative, truckloads of 'civil guards' to take over the Barcelona central telephone exchange, operated mainly by the CNT union, and to disarm the workers. The instantaneous and spontaneous reaction

was a general strike in Barcelona for three days and armed clashes of the workers' militias with the police, resulting in hundreds of dead and wounded. Finally the government had to disown its police chief, and the police as well as the workers' militias withdrew. However, the 'May days' were immediately exploited by the PCE which presented the events as an "insurrection prepared by the Trotskyists of the POUM with the help of German and Italian police". On May 15, the communist ministers demanded complete suppression of trade unions in Catalonia and placing of the Catalonian press and police under what would in practice have amounted to communist control. They particularly insisted on the suppression of the POUM and the arrest of all its leaders and their prosecution on "the absurd charges of treason and collaboration with the enemy" (Brenan 1969]. The head of the republican government, Caballero - a left socialist refused their demand, but finally had to resign, being replaced by the right socialist Negrin. Ultimately the POUM was dissolved and its leaders were brought to trial. However, the tribunal, set up by the government itself, after courageously resisting the official pressure, dismissed the charges of 'espionage' and 'betrayal' as trumped up and talse, though it sentenced the POUM leaders to various prison terms for disobeying the authorities [Bolloten 1991]. \* The most despicable part of the episode was the tragedy of the POEM leader Andres Nin, one of the finest revolutionaries of Spain. Arrested at the same time as the other leaders of the party, he was handed over to the head of the Russian secret police in Spain, Orlov, who confined him in a private prison in Barcelona and made him undergo torture in order to extract 'confession' a la the (in)famous Moscow show trials. Unable to obtain any 'collaboration', the secret police simply assassinated him. 17 FClaudin, the exleader of the communist youth in Spain, would later write that Nin's assassination was an "outrage against communism" [Claudin 1970]. At the same time a new political police, the notorious "Servicio de Investigacion Militar' (SIM) was created, controlled by the PCE and the Russian 'technicians', outside the control of the government. On the other hand, almost half of the Barcelona state prison, 'Carcel Modelo', was filled with the members of CNT-FAI and POUM. F Challage from Paris and J McGovern from London, leading an enquiry in November 1937, were surprised. at this prison, by the sight of the hundreds of prisoners singing Internationale. When McGovern - an Independent Labour MP went to visit one of the secret prisons maintained by the PCE in Barcelona called 'priventoriums', he could not get admission even with a signed order from the director of prisons and the minister of justice. When he asked the prison official "who was his boss, he gave us an address to the Cheka headquarters". The minister of the interior had to tell him: "We have received aid from Russia and have had to permit certain actions which we did not like" [McGovern 1938]. Finally, let us note that beginning with the second half of 1937, when the Russian 'technicians' started to be recalled to Moscow, almost all those who were called 'Spaniards' in Russia began to 'disappear' shortly after they had arrived in Russia. These included notably, among others, Rosenberg, ambassador to Spain; Antonov Ovseenko, Consul General at Barcelona; Koltsov, Pravda's correspondent; and General Goriev, the veritable organiser of the defence of Madrid.

More than anywhere else, the situation in Spain in the 1930s looked like what Marx had called in 1850 "the revolution in permanence" - a democratic revolution immediately going over into a proletarian revolution The talse Comintern-PCE orientation of 'democracy vs fascism', to which the dominant anarchist leadership came to subscribe, destroyed this great opportunity The PCE thus acted as a "countercurrent to the profound dynamic of the Spanish revolution" [Claudin 1970]. Realising - shortly after the civil war - the great mistake the anarchists had committed in believing that in order to win the revolution the war had to be won first, one of their leaders wrote: "We have sacrificed the revolution itself without understanding that this sacrifice entailed the sacrifice of the aims of the war" [Santillan 1940].

# III Bolshevism, Commune, Socialism

Ahmed sees the 'Bolshevik Revolution as the "logical culmination of the Paris Commune", and then speaks of "Soviet Socialism" (pp 1329, 1330), which presumably is the type of "Socialism: for which the 'Left' stands and to which "the allies of the Lett in the Third Force are deeply hostile" (p 1343). We take up the two issues in turn.

BOLSHEVIK REVOLUTION AND THE COMMUNE<sup>18</sup>

'Bolshevik Revolution' refers to the seizure of political power by the Bolshevik Party in Russia in October 1917. Though power was seized in the name of the working class, it was not the working class that seized the power nor was the power installed a working class power. It was not the working class's own organs like the soviets and the factory committees which seized power. It was the Party Central Committee which took the decision secretly to seize power without the

knowledge of the working class's self-administered organs, even without the knowledge of the ordinary members of the Party itself. And seizing power before the Second Congress of the Soviets could meet, the Party leadership placed before the Congress a fait accompli. An undisputed authority on the soviets writes: "The October revolution was prepared and accomplished under the slogan of 'all power to the soviets'. However, an examination of the historical reality shows that only a fraction of the workers', sailors' and soldiers' deputies themselves wanted the seizure of power" [Anweiler 1958].

Lenin, equating "proletarian power" with the "Bolshevik power" (1982a:381; 1975:383),14 wrote, six months after the scizure of power: "We the party of the Bolsheviks, conquered (otvoevali) Russia from the tich for the poor... We must now govern Russia" (1982a: 596; 1975:589).<sup>20</sup> How very different was the experience of the Commune! The Paris Revolution was literally a people's revolution. "The workmen of Paris have taken the initiative of the present Revolution", wrote Marx, "it is the people acting itself for itself' [Marx 1971]. The Commune resulted from "the rise of all living Paris against the government of defence" [Marx 1971], whereas the Bolshevik seizure of power, carried out without the knowledge of the vast majority of the people of Petrograd, involved a small fraction of its 4,00,000 workers. The historians have written that "this was not a rising of the masses as the March (February) revolution and the July days had been... Most people in Petrogard did not even know that a revolution was taking place. The trains were running, the fashionable restaurants were crowded, theatre was crowded and Chaliapin was singing at the Opera" [Taylor 1977]. 'Even the members of the provisional government did not see that power had slipped from their hands and that it was now in the hands of the Bolsheviks" [Heller and Nekrich 1982]. Finally the National Guard into which "all Parisians capable of bearing arms had enrolled and where workers constituted the great majority" [Engels 1971] was, unlike the Bolshevik Party, the working class itself which, as a body, freely chose to entrust the supreme power to the Central Committee of the National Guard. This National Guard was anything but a 'vanguard party' in the sense of Lenin. It was closer to Marx's idea of "the working class constituting itself into a party".

What was the nature of the Commune? "That the Revolution is made in the name of and confessedly for the popular masses", wrote Marx, "is a feature this (commune) Revolution has in common with all its predecessors. The new feature is that the people... have taken the actual management

of their Revolution into their awn hands...(and that) workmen govern Paris" [Marx 1971; first emphasis is in text, the second is ours]. As if to contradict this Lenin told the Party's Eighth Congress: "Till now we have not reached a stage where the labouring massess could participate in government" (1982b:115; 1971:182). E H Carr cites Lenin's 1921 statement: "Can every worker know how to administer the state? Practical people know that this is a fairy tale" [Carr 1964]. Lenin had 'forgotten' that he himself had told this "fairy tale" in his pre-seizure ('impractical') days. Marx and Engels noted that the Commune had destroyed the old state machinery instead of simply taking it over. The very first decree of the Commune was the suppression of the standing army and its replacement not by another standing army but by the armed workers. Similarly the police was turned from a repressive agent of the government into a responsible and "at all time revocable agent of the Commune". The Commune not only "got rid of the standing army and the police", the Commune also filled all posts administrative, judicial, educational - by election on the basis of universal suffrage, subject to recall at any time by the same electors. Similarly all officials, high or low. were paid only the wages received by other workers. Needless to add, these measures included the Commune members themselves.

In his 'fairy tale' ('impractical') days Lenin had designated precisely these features of the Commune as the "Commune's essence" and had denounced the "Plekhanovs and the" Kautskys" of having "forgotten and perverted" it. In the post-seizure period, when the Bolsheviks became 'practical people', they, in their turn, also 'forgot and perverted' this very essence of the Commune. However, the Bolsheviks' 'forgetfulness and perversion' were infinitely more serious than those of 'Pickhanovs and Kautskys', masmuch as these no longer remained in the realm of ideas but were faithfully translated into (Bolshevik) practice. On the morrow of the seizure of power, when the old army had practically melted away, the Bolsheviks created, thanks to Trotsky's genius, a new standing army - 'Red', of course - abolishing the earlier declared principle of election of officers, clipping the rights of the soldiers' committees and employing the old Tsarist officers in the key posts in increasing numbers [Anweiler 1958]. A similar development could be seen in the rise and consolidation of a special police apparatus - 'Vecheka' or 'Cheka' - which, established just five weeks after the seizure of power, rapidly grew to over a quarter million by mid-1921 [Schapiro 1984]. Simultaneously a bureaucratic apparatus, entirely nominated from above and hierarchically organised - the officials being responsible only to their superiors in the hierarchy - increased with gigantic strides. All the important office-holders were simply party nominees through a system directly taken over from the Tsarist 'Table of Ranks' - the so-called Nomenklatura. Thus the Russian reality completely contradicted Lenin's assertion that the Soviet Republic was a "continuation" of the Paris Commune. Indeed, shortly before his death, Lenin admitted that "we effectively took over the old state apparatus from the Tsar and the bourgeoisie" (1982b:695; 1971:742).

# 'SOVIET SOCIALISM'

The soviet movement arose spontaneously in 1917 (as it did in 1905), independently of the political parties and much to their astonishment. I Starting in the capital, the movement spread to all the corners of the land, first confined to the workers and soldiers and then englobing the peasantry. The soviets were composed of deputies, elected and subject to recall by the working people and soldiers themselves. In this as well as in their spontaneous rise as a popular revolutionary movement, the soviets resembled the Paris Commune.

A minority for the first few months, the Bolsheviks had gained, by early autumn, clear majority in the soviets in the important urban areas. In the vast rural areas they remained a small minority in the peasants' soviets. "All power to the soviets" was the great mobilising slogan of the Bolsheviks. However, what Lenin really wanted was all power to his party. This is clearly seen when in the very first Congress of the Workers' and Soldiers' Deputies, there the Bolsheviks constituted less than a seventh of the delegates, Lenin declared that his party was ready to assume power (without consulting anybody in the party thus including his own enunciated principle of 'democratic centralism').22

Again, about one month before taking power, on the strength of the party's majority in the Petrograd and the Moscow soviets alone, Lenin insisted that the "Bolsheviks can and must take state power into their own hands (v svoi ruki)" and that "it would be naive to wait for a formal majority for the Bolsheviks" (1982a:325-26; 1975:328-29; the first emphasis is in the text, the second is ours). Even when it was clear that in the Second Congress of the Soviets the Bolsheviks together with their allies would have a clear majority, Lenin, unsure of the outcome of the normal democratic process, wanted the party to seize power by force even before the Congress would meet "It would be ruinous or a formality to wait for the wavering vote of October 25. The people have the right and the duty to resolve such questions not by vote, but by force" (1982a:413; 1975:416). It is Lenin alone, it seems, who had the 'right' and the 'duty' to determine this right and this duty for the people. The Provisional Government was dismissed not by the Congress of Soviets, not even by the Petrograd Soviet, but by the so-called Military Revolutionary Committee of the Petrograd Soviet - where all the members were Bolshevik except one, the president, a left socialist - by a decree drawn up not by its president, but by Lenin (again without consulting anybody, including his party, violating once more the principle of democratic centralism) [Ferro 1980]. By July 1918, the locus of decision-making shifted from the soviets to the party, notes an American historian "The whole system of soviets and executive committees were reduced to an administrative and propaganda auxiliary of the party" [Daniels 1967]. "The soviets were transformed from organs of the proletarian self-rule and vehicles of radical democracy into organs, allowing the party elite to lead the masses" [Anweiler 1958]. E H Carr cites a resolution of the Eighth Party Congress (1919): "The Russian Communist Party must win for itself undivided political mastery in the soviets and political control over all their work", and then adds, referring to what really happened within three years of the seizure of power, that the "ultimate power of decision rested with the appropriate party organ", and that "central soviet organs and local executive committees both ultimately recognised and authority outside the soviet system" [Can 1964: our emphasis].

By the side of the soviets another organ of workers' self-rule arose in Russia in 1917 - the factory committees, organised by the industrial workers alone. While the soviets in course of their growing institutionalisation were often not in direct contact with the working masses at the base, the factory committees, elected by the workers and subject to recall by their electors, were in daily contact with the workers at the shop floor and to that extent they directly reflected the changing temper and growing revolutionary experience of the workers. By October 1917, these committees, now spicad all over the industrial centres, had successfully pushed the trade unions in the background, and, independently of any law, they were directly intervening not only in the questions of day-to-day production, but also in those of enterprise management, frequently bringing the factories under the collective possession of the workers after expelling the legal owners [Avrich 1963: Ferro 1967]. The Bolsheviks had found in them an ideal instrument of propaganda and, in fact, these became a Bolshevik stronghold fairly rapidly. However, after the seizure of power, these factory committees, like the soviets, underwent a 'radioactive decay'. The trade unions, now dominated by the

Bolsheviks, succeeded in annexing them and transforming them into their own organs at the lowest level, thus ending the sovereignty of these organs of workers' selfrule. The practice of collectively administering the aftairs of work places by the workers themselves through their elected organs, carlier championed by the Bolsheviks, was now denounced as "petty bourgeois, spontaneity" by Lenin who, at the same time, stressed the importance of "raising labour discipline and labour productivity" through such typical bourgeois measures as single-person management "vested with dictatorial powers (diktatorskim polnomochiyamı)", Taylor system and piece work (1982a:630; 1975:622)

It should be clear that in the light of the effective liquidation of the soviets, including the factory committees — which had their own 'soviet of factory committees' — as the working people's independent organs of self-rule, the first term of 'soviet socialism' evaporates (in its original revolutionary sense). Could the system be still qualified as some kind of (non-soviet) 'socialism'?

Russia was formally declared 'socialist' in the middle 1930s (earlier it was supposed to be in the transitional phase between capitalism and socialism). The fundamental reason given was the alleged 'public [that is, mainly state) ownership', equated to 'socialist ownership', of the means of production, And, following Stalin, ownership formed the basis of the production relation (1980 505),71 A party resolution echoing Stalin, qualified this 'socialism' as the "first phase of communism" [KPSS 1971:335]. How do the materialists characterise socialism? Exactly in the same way as they characterise any other social formation, that is, by the specificity of the social relation of production (not by ownership relation or forms). Just as the social relations of production in capitalism are based on the separation (alienation) of the immediate producers from the conditions of production, in the same way the social relations of production in socialism - the antipode of capitalism - are based on the free union of the immediate producers with the conditions of production to which corresponds the "associated mode of production" as opposed to the "capitalist mode of production". It should be noted that to designate the postcapitalist society Marx does not distinguish between socialism and communism, which he also calls, alternatively, Union. Associated Associated Labour, Republic of Labour - the postcapitalist society going through (at least) two successive phases. 4 There is no specific 'transitional society' preceding socialism (communism). The new society emerges from the capitalist society itself. In this profound sense capitalism is the transition to socialism [Marx 1962b:426; 1978b:429]. However, there is a transitional period called by Marx "revolutionary transformation period" under the absolute rule of the working class, during which capitalist relations are increasingly revolutionsed till a point is reached where the producers cease to be proletarians, commodity production and wage labour go out of existence, and the state, by definition a repressive machinery. evaporates. Correspondingly, it is society itself, after getting rid of the state, that collectively appropriates the conditions of production - in which case only one could speak of 'social ownership' - and takes charge of allocation and distribution of the results of production. This is socialism as originally conceived by Marx where, as opposed to individual's "personal dependence" - as in pre-capitalism - and "material dependence" - as in capitalism there is "free individuality" [Marx 1953:75], where "the development of the human power is an end in itself [sich als Selbstzweck]" [Marx 1964:828; 1984:820]. Here at last the 'pre-history' of humanity ends and its 'history' begins, in Marx's famous 1859 formulation.

What was the nature of 'socialism' that was inaugurated in Russia in 1930s? First of all, it should be clear that the "revolutionary transformation period" under the absolute rule of the proletariat as a class preceding socialism did not exist in Russia. As we argued above, it was a dictatorship over the proletariat by the party, standing above and completely autonomised from the immediate producers, with all the levels of power concentrated in its hands. The state which, under the proletarian rule, is supposed to be already "no longer a state in the proper sense of the term" (Engels) - that is, with much of its repressive power already gone - became on the contrary, in Russia increasingly oppressive and, to paraphrase Marx, the Bolsheviks (unlike the Communards) "perfected the state machinery instead of throwing off this deadening incubus".25 Thus lacking the necessary pre-conditions, the advent of a socialist society in the post-October Russia was out of question. Under a state completely monopolised by the party over which the producers had no control, 'public' or 'social ownership' in the means of production simply signified nonownership of the producers over the means of production, the juridical fiction to the contrary notwithstanding. For most of the 'socialist' period, the producers' nonproperty in the means of production meant also their separation from the conditions of production at the level of the individual commodity producing units of production. In other words, the industrial wokrers continued to be wage labourers under what

20

the Russian rulers called - by a singular inversion of categories - the "lower phase of communism", where, in fact, in Marx's famous paraphrase of Ricardo, "the means of production employed the labourers, the labourers did not employ the means of production". For about 15 years - from the late 1930s to the early 1950s - the wage labourers were also subject to non-economic constraints, such as labour books, legal prohibition on leaving jobs, severe penalties for absenteeism, compulsory transfers for the skilled workers - leaving aside the question of the great number of prisoners working (productively) from inside the labour camps. There is no evidence that these constraints were self-imposed by the workers themselves. The situation of the immediate producers in the countryside was even worse. They were, for a long time, subjected to compulsory corvee like road building and timber cutting, which did not apply to the city dwellers, and, in the words of a foremost authority, they were "subjected to a labour system which reminded them of conditions from which the revolution seemed to have redeemed them forever" [Lewin

We conclude that there was no socialism in Russia. Indeed, if we take 'soviet' and 'socialism' in their original revolutionary senses, then that which the 'Left' calls 'Soviet Socialism' turns out to be anti-soviet antisocialism.

# **Notes**

[Citations from non-English sources are given in our own translation. Wherever possible, their English versions are also referred to. In that case the first reference is to the original version, the second to the English version.]

- 1 In the following lines 'communist party' and 'communists' in general refer uniquely to the leadership of the party at the highest level, unless otherwise qualified.
- 2 This is a somewhat surprising argument worthy of the 'social democrats' - in Ahmad's pejorative sense - who would like to hang on to power, unlike the communists who are supposed to challenge the existing order in a revolutionary way, even at the cost of losing the governmental power. In any case it is not at all clear how a 'social democratic' government would behave in a similar situation. Here a recent pertinent comment by the EPW is worth citing. Referring to the Indian Leftists' "problem of retaining and continuing its adherence to the basic principles of socialism", it added: "A Left Front ruled West Bengal... was expected to provide an alternative model of government that would heed to the demands of the common people for an end to corruption and police atrocities on the one hand and for the restoration of the sick industries which have thrown thousands of workers out on the streets on the other. On both counts the Left Front government has

- failed. Its increasing dependence on and compromise with big industries are making it indistinguishable in these respects from either the Congress or the BJP ruling parties in other states' (EPW, Vol XXXI, No 28, p 1812).
- 3 Speaking of "India's strategic ambitions to develop nuclear capabilities kept well hidden for decades under the cover of peaceful nuclear programmes", EPW has correctly observed that "what is particularly ominous is that the entire range of mainstream political parties from the right to the left share a consensus on this issue" (Vol XXXI, No 26, p 1636, our emphasis). Or maybe we are wrong. Maybe the 'Left' has discerned beneath the class language cover of the 'bourgeois-landlord classes' that these classes are pursuing the relentless arms programme not to strengthen their (repressive) state machinery, but really to develop weapons to destroy 'imperialism'. But even in the latter case our argument about 'consensus' holds, though it is now around a 'iust cause'.
- 4 With this kind of ultra chauvinism, one wonders how CPI(M) can still claim to be the followers of Lenin who, to his great credit, was an out and out internationalist and a firm partisan of the right of self-determination including the right to secede of the minority, nationalities of a country. Quite possibly the CPI(M)'s position constitutes a creative application of (Marxism) Leninism in the era of decline and fall of 'socialism'.
- 5 See de Oliviera Marques (1972), Bourdon (1985); Durand (1992).
- 6 See also Tanin and Yohan (1934).
- 7 For Iran we draw on Arani (1979) and Cottam (1979, 1980).
- 8 To the credit of Trotsky, he, in 1930, called for a united front of the commuists and the social democrats against fascism and qualified as "absurd" the idea that fascism could not be defeated without the prior defeat of the social democrats Similar also were the views of Bukharin, accused of being a 'rightist', who called for a "single proletarian front".
- 9 We cannot leave this brief note on the German party's positive role in the rise and victory of German Fascism without mentioning workers' massive uprising in Germany at a later date, which did not require any fascist government to suppress it. The 'working class leadership' was at hand for the job. In the 'Socialist' German Democratic Republic there was a massive working class uprising against the regime, begining on June 17, 1953, first in the form of widespread strikes against low wages and high cost of living, and then increasingly taking political overtones. In view of the popular character of this uprising Brecht wrote a poem where he advised the party to dissolve the people. who did not deserve the party's confidence, and elect a new people [Brant 1955; Heller and Nekrich 1982].
- 10 National Confederation of Labour and Iberian Anarchist Federation within the former. One of the best accounts of the development of the anarchist movement in Spain is in Brenan (1969) For CNT the best reference is the monumental three-volume work by J Peirats (1951-1953).
- 11 These dissident communists, Workers' Party

- on markist Unification (FUUM) was numerically small, almost confined to Catalonia, but contained an unusually high proportion of politically conscious members. POUM would be increasingly villified by th PCE; falsely and conveniently, as 'Trotskyists' ('Trotsky-fascists') which it certainly was not. The Trotskyists had their own independent party, so tiny as being of no importance.
- 12 The first phase of the revolution from the rise of the 'committees' and the corresponding workers' militias to the disbanding of the former and the disarming of the latter by the republican government spearheaded by the PCE is brilliantly portrayed in the recent film by the independent Marxist Ken Loach, Land and Freedom, which is also notable for its high aesthetic qualities.
- 13 Orwell, who was fighting in the POUM ranks on the Aragon Front, wrote: "The thing that had happened in Spain was not merely a civil war, but the beginning of a revolution. It is this fact that the anti-fascist press outside Spain made it its special business to obscure The issue has been narrowed down to 'fascism vs democracy' and the revolutionary aspect concealed as much as possible. Outside Spain few people grasped that there was a revolution; inside Spain nobody doubted it" [Orwell 1966]. Bolloten cites F Claudin, an ex-PCE leader: "In the weeks after July 19, the capitalist order practically ceased to exist in the Republican area, the means of production and political power in effect passed into the hands of the workers' organisation. All historians of the Spanish Civil War are in agreement on this point except for those who do not aim for historical truth, but to justify the policy of Stalin and the Commtern" [Bolloten 1991]
- 14 The International Brigades distinguished themselves particularly by their magnificent defence of Madrid. For a synthetic account of the Brigades see Delaperrie de Bayac (1968).
- 15 Formally he was a member of the 'Unified Socialist Party of Catalonia' (PSUC) which resulted from a merger of Catalonia's socialist party and communist party. PSUC was affiliated to the Comintern.
- 16 It was a bitter pill for the Comintern. In his report to Moscow Togliatti called the sentence "outrageous", which was "no serious punishment" The PCE simply did not publish the judgment [Bolloten 1991]
- 17 Pravda had written on December 17, 1936: "So far as Catalonia is concerned, the cleaning up of the Trotskyist and anarcho-syndicalist elements has already begun, and it will be carried out with the same energy as in the USSR." The torture and assassination of Nin by secret police would later be revealed by a PCE leader, J Hernandez, minister of education under Negrin, after the civil war when he had escaped to Mexico from Moscow [Hernandez, 1953].
- 18 We assume that by 'Commune' the author means the Commune of 1871 and not the Commune of Paris which arose during the French bourgeois revolution of the 18th century.
- 19 To bring out the spirit of what Lenin was saying, the term vlast is more appropriately rendered as 'power' rather than 'government' as in the Moscow translation.

- 20 1 rotsky, second to Lenin in the party leadership, wrote in 1920: "The substitution of the power of the party for the power of the working class is, basically, no substitution at all."
- 21 To the glory of Russia's women, the soviet movement was initiated by the women of Petrograd on the International Women's Day, February 23 (March 18), the women's role being crucial not only in leading the beginning stages of the movement but also in disarming the forces sent to repress it.
- 22 In a famous justification of the Bolshevik monopoly of power Lenin asserted not long before the seizure of power that if 1,30,000 landlords could role Russia, then so could 2,40,000 Bolsheviks, of course "in the interest of the poor and against the rich" (1982a:367; 1975-369).
- 23 Stalin's formulation was of course a complete inversion of the materialist position according to which "juridical relations arise from production relations" and property relation only "reflects (widerspiegelt) economic relation" which is its "content (Inhalt)" (Marx 1962a. 99, 1978a:88, 1966:177; 1970:318). The Moore-Aveling English translation of the relevant text in Capital I is rather poor.
- 24 Thus, contrary to a widespread idea shared also by at least the majority on the 'Left' - socialism is not the transition to communism.
- 25 The 'Left' the modern day statists should note well that Marx had praised the Communards for their "Revolution against the State itself" (1971: 152; emphasis in original). Later Engels severely criticised the "statist superstition" of the German Social Democrats.

# Economic Rights of Women in Islamic Law

# Flavia Agnes

The law of marriage in its essence is a law regulating economic transactions and woman's access to and control over it. The Islamic provisions of 'mehr' and marriage agreements, and right of property management have stood Muslim women in good stead during litigation in the last century. However, gradual infiltration of Hindu notion of sacramental marriage and English principles of morality and public policy have curtailed Muslim women's rights granted under Islamic jurisprudence. Muslim leadership needs to give up its attitude of negating women's rights if it aspires for support of secular and human rights forum in the period of aggressive Hindu communal propaganda for uniform civil code.

THE law governing marriage and family relationships in its essence is a law of property settlement rather than a law governing sexual morality. Hence, any proposal for reform would have to necessarily redefine property rights of women within the family. This consciousness has led both conservative as well as progressive forums now engaged in drafting alternate codes to focus more upon the economic rights of women rather than confine the debate to issues of monogamy and sexual control.

In this context, even the Hindu fundamentalist political parties like the BJP have been forced to acknowledge that the Hindu law of succession does not grant rights to women and hence while enforcing a uniform code, the concept of Hindu joint family property may have to be abolished.

Most legal scholars concede that the Muslim law of inheritance protects women's rights better than the Hindu law based on male coparcenary. But in the realm of matrimonial law, it is presumed that the Hindu law (which is a reflection of the archaic British law) will be more favourable to women than the Muslim law which permits polygamy and triple talaq. In fact, the rationale for a uniform code is based on this premise, i e, liberation of Muslim women

The present Hindu law of marriage and divorce is a curious mixture of Victorian morality, Hindu notion of women's servility and the modern concept of a contract between equals, which collectively work towards the subordination of women. Since it has nothing to offer in the realm of economic rights, we need to take recourse either to the Continental system which is based on equitable distribution of matrimonial property or to the Islamic concept of mehr.

Unfortunately, due to the communal undertones which usually accompany the demand for a uniform civil code, the contribution of Islamic legal principles to the modern matrimonial jurisprudence has not received due recognition. For instance, the Islamic principle of marriage as a dissoluble contract was borrowed first by the Continental and later by the British matrimonial juris-

prudence, to set off the Christian notion of marriage as an eternal and indissoluble sacrament, while ushering in modernity. This concept was incorporated into the Hindu law in 1955.

In the British legal system, divorce, in its origin, was confined to faults, where one spouse had to prove a matrimonial offence against the other. And if women were the 'guilty' spouse, they would be deprived of the meagre maintenance dole and additionally their property could be settled in their husbands' favour as compensation for the loss of proprietary rights.

In contrast, the Islamic law provided for more civilised modes of dissolving marriages, either by consent or by providing for irretrievable breakdown of marriage. Only in the later half of 20th century the British matrimonial jurisprudence accepted the concept of divorce by mutual consent. This was incorporated into the Hindu law in 1976. The Indian Divorce Act which governs Christian marriages has not recognised this concept to date and the only option open to consenting spouses under Christian law is collusion and perjury. The notion of 'no fault divorce' (or irretrievable breakdown of marriage) has not yet been accepted by the Hindu law.

Under Islamic law, while the husband is granted an unlimited right of divorce, the wife is also granted a limited right of khula. To equalise the status of spouses within marriage, the neighbouring Pakistan and Bangladesh have, at one level curbed the husband's right of oral talaq by stipulating mandatory arbitration procedures, and at the other level, secured the woman's right to khula through standardised marriage contracts, nikah-nama. The contract includes a routine clause through which the husband is bound to grant the right of khula to the wife at the time of contracting the marriage. The Supreme Court of Pakistan in the landmark decision in Khurshid Bibi's case while interpreting this provision held that hatred or aversion towards the husband is sufficient for obtaining khula and ruled that the consent of the husband is not a necessary precondition.

The provisions of arbitration and speedy settlement of matrimonial dispute are also important principles of Islamic matrimonial jurisprudence. If arbitration procedures fail, the matrimonial bond should be severed with ease, ahsan. Several judgments of high courts in Pakistan have relied on this principle and have held that marriage should be dissolved through a simple deed and anyone who makes it complicated will stand ostracised.2 This concept has gained statutory recognition in India, through the family courts act which provides for. arbitration and speedy settlements rather than prolonged adversarial litigation of the British system, where one spouse is required to prove the matrimonial offence against the other, which causes great hardships and humiliation to women in court rooms.

Since Islamic law provided the modern matrimonial jurisprudence with important legal principles, perhaps it would be worth our while also to examine the Quranic right of mehr which was meant to provide a safeguard against arbitrary oral divorce. This right of providing for the future security of the woman at the time of marriage, finds no parallel in any other legal system.

All provisions of dissolving a marriage become detrimental to women if they are not simultaneously linked to protection of economic rights. It is this court room reality which makes it imperative to examine the rights of mehr and pre-marriage agreement bestowed upon women under the Islamic law.

SUPERIOR POSITION OF WOMEN IN ISLAM

Mehr is a Quranic right. A specific mention of this right is made in all subsequent legal texts. Chapter IV verse 3 of the Holy Quran stipulates: "And give women their dower freely and if they are good enough to remit any of it of their own free will, then enjoy it with a good conscience". There is also a mention that the Prophet settled 500 dhirams on each of his wives with the exception of Omm Babeebah (from Abysinia) on whom he settled 4000 dhirams.

According to the Maliki school of Islamic law, a marriage without the stipulation of

ment is invalid. According to the Hanafi school the marriage is valid but if no mehr is stipulated or if the amount stipulated is very low, the woman is entitled to a proper mehr, mehr-el-misl. The proper mehr would have to be determined depending upon the means of the husband and the family status of the wife.

While a minimum of 10 dhirams is mandatory, the legal texts routinely mention amounts of 1,000 and 2,000 dhirams by way of examples which indicate that the amounts settled were meant to be far above the lowest stipulated. Additions to the amount stipulated at the time of marriage can be made at any time during the marriage. Mehr is a mark of respect to the wife and is meant to set off the disability suffered by women under the law of inheritance. Hence, the amount stipulated has to be substantial. A token amount is injustice and wrong as per Islamic principles

If the mehr is prompt it is payable on demand. If it is deferred, it must be paid subsequently and in any event upon dissolution of marriage either by death or divorce. If at the time of dissolution of marriage the mehr dues are unpaid, the woman is entitled to retain possession of her deceased husband's property. Usually this right is discussed in legal texts as a 'widow's right' but the same principle would apply if the marriage is dissolved by divorce.

A woman has the right to impose conditions regarding her mehr. For instance she can stipulate that if the husband resides in the same city as her parents then the mehr amount would be 1,000 dhirams, but if he shifts to another city then the amount should be doubled. In such a case if the husband does shift to another city then the wife is entitled to claim 2,000 dhirams.

Mehr need not be stipulated only in cash. Gold ornaments, valuables and other movable and immovable property can also be settled as mehr. Mehr is the sole right of the wife and the husband cannot have any claim over it once the marriage is consummated.

The husband can settle his share of family property or a particular house as mehr. The woman would then be entitled to this property or its monetary value. If the woman claims that the matrimonial residence has been given to her in lieu of her mehr debt, it is for the husband to rebut the presumption If the husband refuses to pay the prompt mehr upon marriage, the woman can refuse to fulfil-her marital obligations including cohabitation. She is not bound to obey any of his commands. The wife is entitled to live separately and claim maintenance from her husband during this period. Even if the husband has paid nine dhirams and one dhiram is due, the wife has a right to refuse cohabitation and the husband is not entitled to reclaim the nine dhirams already paid.

If a man agrees to pay a certain amount of mehr upon the condition that the wife is a virgin and subsequently discovers that she is not, he cannot retract from his commitment and the woman is entitled to the full amount. Once settled, the husband cannot be absolved of his duty to pay the dues, even when there is a subsequent separation which is caused by the wife's action. Even when a Muslim marries a non-Muslim he is bound to pay her the mehr.

The superior position of women under Islamic law can be ascertained only when we compare it with the status of women under other contemporary legal systems. Under Roman and British legal systems of this period, women lost their rights to acquire, hold and manage separate property upon marriage. The Roman law of marriage which derived its roots from the Judaic law was based on the notion of a patriarchal family consisting of wives, sons and slaves. The head of the family acquired total control over the person, property and labour powers of all the members of his household. The wife was treated as the ward and she had no independent identity.

Under the British system, upon marriage, the woman lost her legal existence. Marriage meant a legal death. All her property belonged to her husband and he could not only use it but even alienate it without her consent. The husband's right to his wife's property was held in such high esteem that even after betrothal, if the woman alienated her property without the consent of the groom, he could sue her for fraud.

Only in the year 1870 a married woman who was legally separated from her husband was granted the right to hold separate property. A married woman did not have the right to enter into a contract either with her husband or with a third party till the year 1935.

The Qurante right of mehr is distinct from the customary right of bride price and the English concept of dower. Many tribes and communities in Africa and Asia followed a custom of bride price where the groom was bound to pay a certain sum to the bride's father to compensate him for the loss of his daughter's labour power. The Prophet changed the concept of bride price to mehr, a sum to be settled upon the woman herself, as a mark of respect and future security to her. The amount settled belonged to the woman exclusively and not to her relatives.

The British jurists used the word mehr and dower interchangeably. But the right of mehr is distinct from the right of dower. Dower, under English law, is a widow's right to be maintained from her deceased husband's property. This right is very distinct from the Islamic right of mehr, which is a right upon marriage and not a right arising upon widowhood.

# JUDICIAL DECISIONS IN BRITISH PERIOD

The personal laws of the post-colonial period are no longer applicable in their pristine form. The rights are based on English translations of the original texts, the legal precedents of the British jurists and the local customs and practices. In order to ascertain the contemporary status, a scrutiny of these sources would be necessary.

While examining the case law concerning women's economic rights within marriage one can discern a curious trend. While judicial decisions throttled the Hindu woman's economic rights by constraining the scope of stridhana, the Muslim woman's economic rights could not be similarly throttled. The legal precedents also indicate that the rights of mehr and pre-marriage agreements were not just illusory rights but were viable economic safeguards.

Several judgments upheld the woman's right to impose conditions upon their husbands through private agreements. As per the Christian doctrine of eternal and indissoluble marriage, pre-nuptial agreements stipulating conditions of a future divorce were deemed to be against public policy. But since divorce was not considered as against public good under Islamic law, Islamic jurisprudence held such contracts as valid.

While adjudicating over matrimonial disputes, if the British jurists relied upon Islamic principles, the agreements were held to be valid. But if they relied upon British notions of morality and public policy, the agreements were invalidated. Some important legal decisions in this direction are discussed below.

In Badarannissa Bibi's case decided by the Calcutta High Court in 1871, the husband had entered into a pre-marriage agreement (kabin-nama) with his wife, authorising her to divorce him if he remarried without her consent. Subsequently, the husband did remarry and the wife approached the court for redress. The court dismissed the wife's plea on the ground that the Mohammedan law does not permit a wife to divorce herself upon a private agreement.

In appeal, an Islamic jurist, Moulvi Mahamat Hossein, appeared for the orife and pointed out the relevant sections from the legal texts which specifically mention the delegated power of the wife to divorce husband and pleaded that such a provision is not repugnant to the Mohammedan law. The court concurred with this view and ruled in the woman's favour.

Under the English law of contracts a person who is not a party to a contract cannot enforce it even when s/he is a beneficiary. Hence the following judgment, Khwaja Mohammed v Husseini Begum<sup>4</sup> discussed in detail, becomes an important milestone in the law of contract in India. The privy council

laid down a new precedent by upholding a minor gul's right to enforce a contract against her father in law even while she was not a party to it

In the year 1877, on the occasion of the marriage of his son, the father-in-law executed an agreement that he would pay the daughter in-law Rs 500 per month as khapch i pandan in perpetuity. After seven years, the wife was compelled to leave the husband's home. Thirteen years later, in 1896, the couple was separated. In 1901, the wife filed a suit to recover arrears. The trial court refused to enforce the agreement on the following grounds.

- 1 It is unreasonable to suppose that wife can enforce her contract against her father in law even when she refuses to live with her husband. To hold so would be repulsive to conscience and common sense.
- 2 The unchastity of the woman has not been proved, but her character is not beyond suspicion
- 3 If she refuses to live with her hu band the father in law has no duty to pay kharch-r pandan
- 4 The ausband entertaining prostitutes at home and incurring debts are not reasonable justifications for wife strefusal to live with him

In appeal the Allahabad High Court decreed in the wife's fivour as follows

- No condition had been attached to the payment of the annuity
- 2 Nothing is said in the agreement about the chastity of wife
- 3 Noprovision is stated under which father in law ce ises to be liable if wife stops living with ner husband or due to any other acts of the wife

In an Appeal against this decree to the privy council by the husband it was held

- 1 Although she was not a party to the agreement the wife was entitled to enforce it is she was the only beneficiary of the agreement. In India and among Muslim communities, mairrage is contracted by parents/guardians on Fehalt of minors. Hence serious injustice will be caused if the common law doctrine (read English law doctrine) is applied to agreements entered into an connection with such contracts.
- 2 The wife had not forfeited her right to tae allowance on her refusal to reside with her husband. By the agreement, the father in Tawbands himself unreservedly to pay to the wife the fixed allowance. There is no condition in the agreement that it should be paid only while she is living in the husband's house.

The court admonished the subordinate judge for his tenturk that the woman's character was not free from suspicion, and held that if the allegation of unchastity was

not proved, it was incorrect to make such derogatory comments in the judgment. The court also drew a distinction between kharch-1-pandan and the English concept of 'pin money' which could only be spent with the consent of the husband. In contrast, the Muslim woman could exercise her sole control over her kharch-1-pandan Explaining this concept the court ruled, "Kharch-ipandan, which literally means 'betel box expenses' is a personal allowance to the wite customary among Mohammedan families of rank, especially in upper India, fixed either before or after the marriage When they are minors, as is frequently the case the arrangement is made between the respective parents and guardians."

In a case decided by the Allahabad High Court in the 1921,5 the husband had married twice and had treated both wives with cruelty. The father of the third wife entered into an agreement with the husband and his father prior to the marriage, binding the husband to pay a sum of Rs. 15 per month for life, in addition to the dower debt, in case of divorce.

The wife was subsequently divorced and she approached the court for the enforcement of her contract. The court held that the agreement was enforceable as it was meant to secure the wife against ill-treatment. The court countered the plea that pre-marriage agreements are against public policy and held that agreements protecting a woman's future rights are valid under Islamic law.

# PUBLIC POLICY TREACHEROUS GROUND

While upholding the right of a Muslim wife to enter into agreement in respect of future maintenance, the Lahore High Court made an interesting comment regarding the notion of public policy. There is nothing in the husband's promise to pay a certain sum of money for the personal expenses of his wife which can be regarded as opposed to public policy. The court further cautioned. Public policy is unsafe and treacherous ground for legal decisions. It must therefore be kept within reasonable restraint. The

It must be noted that notions such as morality and public policy were English principles which were surreptitiously introduced into the Indian family law to the detirment of women's rights. Based on this premise women's customary and textual rights to divorce to adopt children or to inherit property were constantly curtailed. The following case reported in 1853 is a classic example of how the notion of public policy could be used against women's economic interests.

The case concerns the Muslim trading communities of Gujarat – Khojas and Memons. These communities followed the local custom of holding the family property

jointly! The male-headed coparcenaries denied women their right to a stipulated share in the property, which they were entitled to under the Shariat A woman from the trading family challenged this practice

On her behalf it was argued that the Hindu custom of disinheriting daughters which has been adopted by Mohammedans is most unreasonable and that public policy would dictate the adoption of the wiser rule laid down by the Quran by which daughters are allowed a defined share in the succession A contrast was drawn between the relative position which females hold in Hindu and Muslim systems. It was pointed out that since the Muslim system was more beneficial to women, it was the duty of the court to give it effect when the two come in collusion.

The comments of the concerned judge, Lord Erskine Perry, while disallowing the woman's claim are interesting to note "A custom for females to take no share in the inheritance is not unreasonable or against public policy in the eyes of the English law It accords in great part with the universal custom as to real estates where there are any male issue and with some local customs mentioned in Blackstone by which in certain manors females are excluded in all cases"

While the high courts of Calcutta, Allahabad and Lahore upheld a Muslim woman's right to enter into agreements, the Bombay High Court relying upon the English doctrine of public morality invalidated them

In Mehrally v Sakerkhanoobhar the couple was married in 1901. After a few months due to marital conflict the wife left the matrimonial home. Thereafter, in an attempt to reconcile, the husband executed an agreement stipulating the following.

- 1 He will rent a house and live separately with his wife, away from her family and relatives. If they cannot live together he will pay her Rs 20 per month as maintenance.
- 2 The wife's ornaments (20 to las of bangles, five to las of chain) belong to her exclusively and he would not claim any right over it,
- 3 He would not obstruct her from meeting her friends and relatives

The reconciliation following this agreement lasted only for one year and thereafter, the wife returned to her parents' house. Husband filed for restitution of conjugal rights. The wife relied upon the agreement in her defence. Rejecting the wife's plea, the court held. "The principle upon which the law looks askance at agreements contemplating the future separation of husband and wife, is a principle which is thoroughly fixed, having its foundations in the welfare of society. Hence an agreement which provides for a subsequent separation, is bad under English law."

rine court timen applied this principle to an agreement regarding maintenance in Bai Fatima's case? While contracting a second marriage, the husband executed an agreement in favour of the first wife that in case of disagreement he would pay her Rs 8 per month as maintenance. After separation, the first wife sued for recovering arrears of maintenance. Relying upon the preceding judgment, the court ruled that since the separation did not take place until some weeks after the execution of the agreement the post-nuptial agreement encouraged future separation and hence it was against public policy.

As can be observed, Muslim women were on a firm footing if the courts applied Islamic principles. The decision of the Oudh high court in Mansur v Azizulio is yet another example of this trend. In this case the Court laid down an important principle regarding the Muslim woman's right to shelter or, as formulated in the present context, the right to matrimonial home.

At the time of the second marriage, the husband entered into an agreement granting the first wife option to live separately and claim maintenance of Rs 5 per month in the event of disagreement between the two wives Subsequently, the first wife sued for arrears of maintenance amounting to Rs 58 7 0

Upholding her right of separate residence and maintenance, the court observed. If a Muslim marries two wives and if the wives are not able to get along, and if the husband is not able to provide separate ipartments, agreement in favour of one wife granting her maintenance (guzara) is not against public policy. The court differed from the view expressed by the Bombay high court that such agreements encourage separation. The judgment relied upon two important authorities on Muslim law regarding the Muslim woman stight of separate residence.

I A passage from the Hedaya It is incumbent upon a husband to provide a separate apartment for his wife's habitation to be solely and exclusively appropriated to her use, so that none of the husband's family or others may enter without her permission and desire because this is essentially necessary to her and is therefore, her due the same as maintenance and the word of God appoints her a dwelling house as a subsistence and as it is incumbent upon the husband to provide a habit idon for his wife, so he is not at liberty to admit any person to a share in it as this would be injurious to her, neither is the husband at liberty to intrude upon his wife, his child by another woman. If the husband appoints his wife an apartment within his own house giving her the lock and key it is sufficient as the end is, by this means. fully obtained"

2 A passage from Ameer Ali's Mohammedan Law "Under the Mohammedan law, the maintenance (nafkah) of a wife includes everything connected with her support and comfort such as food, raiment, lodging, etc, and must be provided in accordance with the social position of the parties. The wife is not entitled inerely to maintenance in the English sense of the word but has a right to claim a habitation for her own exclusive use in accordance with the husband's means. It is incumbent on the husband to provide a separate apartment for his wife's habitation to be solely and exclusively appropriated by her, because this is essentially necessary to her and is therefore her due, the same as her maintenance and the word of God appoints her a dwelling house as well as a subsistence'

### KLYSTONE OF ISLAMIC LAW OF MARRIAGE

The judgments discussed above indicate that a Muslim woman's right upon marriage were superior to the English woman's rights But recent research on Muslim societies indicate that these rights have been corroded Mehr is reduced to a mere token and in its place dowry, a custom practiced by the upper caste Hindu society is gaining acceptance. This development is disturbing Due to the ritualistic manner in which mehisettlements are contracted, there is a fear among women's rights activists that this right is not an adequate safeguard against destitution. But the reported judgments of a bygone era bear testimony to a different reality

In Sungra Bibi's a case decided in 1880,11 the unpaid mehi dues at the time of husband's death were Rs 51,000 and the assets left behind by the husband were insufficient to pay the dues. The full bench of Allahabad high court held that the wife was entitled to the whole amount stipulated, irrespective of the fact that the husband's assets were not sufficient to pay the dower debt.

In Kamar un-nissa Bibi's case of the saine period <sup>12</sup> the husband had made an oral gift of the property to his wife in the presence of seven witnesses. I after, he executed a document mukhtar nama to give effect to the gift, which was made in lieu of the unpaid dower of Rs 51 000. However, it was proved that the dower stipulated at the time of mairrage was a mere Rs 100. Decreeing in the woman's favour, the privy council held that it was not necessary to prove that Rs 51,000 was agreed upon it the time of marriage. Under Mohammedan law, mehi may be fixed even after marriage.

The Sultan Begam case of 1936 (AIR 1936 Lah 183) is yet another milestone in this direction. The widow claimed Rs 50,000

out of the stipulated amount of Rs 1,50,000 since the assets of her deceased husband were not sufficient to satisfy the entire amount. The husband's relatives alleged that the dower publicly announced was not intended to be paid and only a smaller amount settled in private was payable. But the privy council validated the *Kabin nama* of 1877 where a sum of Rs 1,25,000 was stipulated. The document was signed by the husband and attested and witnessed by 25 persons. The court held that the fact that the husband did not have the means or expectations to pay the amount was no reason to decree a smaller sum.

This judgment is significant for its observations regarding the right of mehr The privy council commented "Mehr has important uses which affect the domestic life of Mohammedans. The law giver of Islam. was anxious to safeguard the wife against the arbitrary exercise of the right of divorce by the husband. He accordingly devised the institution of mehr to control that right Mehr is a weapon in the hands of the wife to protect her from possible ill treatment by the husband. If she survived her husband and his other heirs ill treated her, she would not be thrown out into the streets but would be able, apart from her legal share to enforce against them her claim which must be paid out of the assets of the husband before they are distributed among his heirs. This is the keystone of the Mohammedan law of mehr in its purity

Protecting the woman's interest auther the courts have also ruled that nichr cannot be absolved in distress. Since the woman has a right to enter into a contract regarding her mehr the Islamic law grants her the right also to opt out of the contract. This is called the right of remittance. This provision is misused by elders in the family and the wom in is coerced into remitting the mehr during the husband's illness or on his death bed Recognising the disability women face during these moments, the courts have ruled that a consent obtained in a moment of distress does not constitute valid consent and the woman does not tortest her rights by this action

The courts have also granted due recognition to a woman's mability to claim her dues during the subsistence of her marriage. In 1855, the privy council held. It is important to consider how inconvenient it would be if a married woman was obliged to bring an action against her busband. It would be full of danger to the happiness of married life. 14

In a series of judgment the courts have ruled that, if at the time of the husband's death the widow's mehi dues are unpaid, and she is already in possession of the property, she has the power to retain possession. In economic terms this is a

substantial safeguard against destitution. The husband's relatives do not have the right to dispossess the widow until her claim is satisfied. Several courts have also held that this right is heritable and transferable.

The high amounts demanded by women as mehr resulted in the enactment of statutes in the states of Oudh (in 1876) and Jammu and Kashmir (in 1920) to protect husbands from the exorbitant amounts claimed by the wives. The statutes empowered the courts to reduce the amount if deemed to be too high and beyond the husband's means.

The amounts mentioned in the judgments cited above need to be viewed in the context of the living standards of this period. Only then will it be possible for us to grasp the security which the high amounts stipulated as mehr provided for women. The salaries for clerical posts in government jobs during this period ranged from Rs 40 to Rs 100. A sum of Rs 10 to Rs 20 was deemed an adequate amount as maintenance.

Although it is possible to argue that the cases discussed above concern women of affluent families, the decisions are a reflection of the prevalent social norms and hence it can reasonably be assumed that mehr was a right which provided the Muslim woman substantial economic protection. The case law also provides concrete evidence that even lower class women did enter into agreements with their husbands to protect their economic rights as the low amounts of settled as maintenance indicate.

# CONTEMPORARY TRENDS

It is in the context of the above legal status that the present situation of Muslim women need to be examined. Despite progressive legal provisions, it is the customs and practices prevalent in the community which determine the status of women in any society.

While the community practices are not homogeneous, nor is the shariat followed in its letter or spirit, recent studies indicate that mehr continues to be an integral part of a marriage contract among most Muslim communities. But the right is corroded beyond recognition. The amounts stipulated are as low as Rs 101 to Rs 501 and only among a minuscule section the amounts exceed Rs 10,000. The communities also practice the dowry system and the amount of dower paid to the groom is always higher than the mehr which is settled upon the woman.<sup>15</sup>

There is a pressure within the community to stipulate a low amount in a ritialistic manner. The practice of pre-marriage agreement is almost non-existent. Although marriage among Mushims is a contract, the Hindu notion of a sacramental marriage seems to have permeated into community practices and high amounts of mehr are

disapproved due to its analogy to a contract of sale. The absence of economic safeguards has upset the delicate balance upon which the Islamic law of marriage had rested and tilted it in husband's favour. The arbitrary oral divorce which cause destitution of women perhaps is a direct corollary to the deterioration of the economic safeguards. Unfortunately, there are no sociological studies which shed light on the social processes which were instrumental to this deterioration.

Partition and the transfer of population which followed it, have resulted in the general lowering of economic and social status of Indian Muslim community. The communal holocausts in the intervening years and the communalisation of political processes in the country have kept ablaze the insecurities experienced by Muslims at the time of Partition. This insecurity has resulted in a narrowing down the visions and aspirations of the community in the post-independent period. In this mileu the rights of women are deliberately allowed to corrode. While the community leadership has been vigilant in opposing state interventions in the realm of personal laws for fear of subversion of its identity, the subversion of women's rights through the process of Hinduisation seems to have caused no concern for the leadership. The insidious co-relationship between dowry and mehr is a case in point.

Another example of this trend is a recent judgment by Justice Tilhari which invalidated the practice of triple talaq. The community leadership opposed the judgment as intervention into the personal laws of the community. But the basic issue which the judgment was meant to address was of land rights. Under state enactments, the woman's individual property was deemed as the

property of the husband as nead of household. This principle is un-Islamic, but this violation of the Islamic principle seems to have caused no concern for the Muslim leadership. 16

The neglect of women's concerns can also be ascertained through the events following the controversial judgment in the Shahbano case. The adverse remarks of the judiciary regarding Islam and the Prophet aroused the wrath of the Muslim leadership which led to enactment of the Married Women's (Protection of Rights upon Divorce) Act, 1986, which the religious and political leaders felt would be more in keeping with the Islamic precepts. The preamble of the act emphasises this.

The act disentitled divorced Muslim women from claiming maintenance under a secular provision of the Criminal Procedure Code (Cr PC). But instead of a monthly maintenance dole of Rs 500 (provided by section 125 Cr PC), the act granted Muslim women the right to a fair and reasonable provision and maintenance, which the Muslim leadership felt were more in keeping with the Ouranic principles.

While the act met with a lot of criticism from progressive and women's rights forums, several courts interpreted the provision in women's favour by granting them lump sum settlements. In one of the earliest cases after the statute came into effect, the judicial magistrate at Lucknow's Diwani Kacheri awarded the divorced Muslim wife a sum of Rs 85,000 as fair and reasonable settlement.<sup>17</sup>

The Gujarat high court<sup>18</sup> while interpreting the clause, reasonable and fair provision and maintenance to be made and paid to her, held that the word 'provision' indicates that something is provided in advance for meeting future needs. At the time of divorce the

115-A, Vikas Marg, Shakarpur, Delhi-110092 Ph: 2458662, 2200954

Musim husband is required to visualise or contemplate the extent of the future requirements and make preparatory arrangements in advance for meeting the same. This interpretation seems to be in confirmation with the cases discussed above. The Kerala high court reiterated this view and held that even a millionaire wife who lives in luxury and affluence is entitled to claim under the act and the requirement of 'not being able to maintain herself' is no longer applicable to Muslim women under the act. 19

It is in this context that the commitment of the Muslim leadership towards its women becomes questionable. Instead of welcoming the pro-women judgments as concurring with the Islamic principle of providing future security to women, the Muslim Personal Law Board filed appeals to the supreme court challenging the Constitutional validity of these judgments. In 1992, Syed Shahabuddin introduced a private members bill in the Lok Sabha to plug the loopholes through which the courts granted women lump sum settlements. 30

But confronted with the aggressive Hindu communal propaganda in the post-Ayodhya phase and its demand for a uniform civil code, the Muslim leadership is today compelled to focus attention to the problems faced by women. It is evident that in the name of protecting its cultural identity, if it pursues its ostrich like attitude of negating women's rights, it will lose the support of secular and human rights forums who had stood by the community in its hour of tribulation following the demolition of Babri Masjid. This political reality has led to some stirrings within the Muslim leadership

At the biannual meeting of the All India Muslim Personal Law Board held in Ahmedabad in October, 1995, a group of Muslim women were invited to present their views. This group has been working on a format of standard nikahnania which could adequately protect women's rights within the Islamic framework. Some of the suggestions formulated by this group are mehr should be stipulated in gold, silver or other valuables so that over the years its value is not depreciated, the nikahnama should provide the woman the right of khoola and talaq-e-tawfeez, a man should bind himself to divorce through an arbitration forum, the husband should not contract bigamous marriage without the consent of the first wife and in the event that he does the wife can pronounce khoola and release herself of the marriage bond and claim her mehr dues. There is also a suggestion that in the event of arbitrary oral talaq the man should be compelled to pay penalty mehr, double or triple the stipulated sum All the suggestions are within the Islamic precepts and subscribe to the theory of

'reform from within' rather than a uniform civil code

Although these suggestions have not yet been accepted, the Fiqah Academy which is the apex body of Muslim jurisprudence in India, in its recently concluded international conference has addressed this issue. Maulana Mujahidul Islam Qasmi a leading Muslim theologian made a plea for structural reforms which would reflect the social realities of Muslim women in India.

While this is one area of law retorm, another area which the women's organisations are pursuing is small specific legislations which would not arouse the controversy of the uniform code and at the same time protect women stights. Bills like Domestic Violence Act and the Right to Matrimonial Home and Property are already on the anvil. The specific statutes are meant to fill the lacunae within the existing Indian matrimonial laws. The bills have been debated in public forums and in the Parlia ment. It will indeed be tragic and ironic if in today's vitiated atmosphere, the Muslim leadership pleads for exemption from their application on the pretext of state intervention, when in fact the statutes would be giving legal effect to Islamic principles of woman's security in a similar manner the principle of marriage as a dissoluble contract was extended to other jurisprudence in the last century

# PREDICAMENTS OF WOMEN AND MANIFELLATIONS BY HUSBANDS

While not denying that the provisions of shariat are patriarchal and reflect a male bias particularly in the realm of penal law and succession rights at least in its origin, the law of marriage was tilted in women is favour, by securing their economic rights. Hence, Islamic principles could be effectively applied to safeguard the women from their husband's manipulations to deprive them of these rights. The following three cases are discussed to draw a parallel between the predicaments of women of the last century and the women of today.

In the first case, Moonshee Buzul ul-Raheem v Luterfutoon Nissa? Rs 10,000 and Rs 1 000 gold mohurs were settled as dyn-mohur (mehr) in 1842. In 1847, the husband remarried. The second wife laid down a condition that the husband should divorce the first wife. But if he divorced her he could be compelled to pay the mehr dues So he treated her with cruelty and denied her food and clothing in order to induce her to ask for divorce, khoola, in which case she would be compelled to forfeit her right to dower.

The mehr deed was in the possession of her mother and the wife informed her of ill treatment and requested the mother to hand over the deed to her husband. The mother filed several complaints against the ill treatment of her daughter in the Fauzdari court and finally obtained permission to visit the daughter. At this meeting the husband informed the wife smother. Thave divorced her. You give up the paptr and take away your daughter. But the mother refused to give up the settlement deed. But in 1850 since the daughter scondition was becoming unbearable, upon her desperate plea, the mother sent over the document and the wife handed it over to her husband. Thereafter, the husband forced the wife to sign a Khoolanama relinquishing the mehi dues

Subsequently the wife filed a suit for the recovery of her mehr dues valued at Rs 26 000 (the 1 000 gold mohars valued at Rs 16,000) in the district court. The case was submitted to the 'moulvie' for his 'Futwa' who proclaimed that as per the Mohammedan law, a Khoolanama cannot be proved without the wife's admission. But since the husband has the power to give talaq the divorce cannot be disputed. Hence the husband is liable to pay the whole dyr mohar, and addit allowance. In an appeal filed by the husband, the Sudar Dewanny Adawlut' upheld, the trial court's decision.

The husband tiled at appeal the privy council which confirmed the lower court order on the following ground. 'Muslim law recognises two forms of divorce, talay and khoola Talaq is the arbitrary act of the husband, who may repudiate his wife at his own pleasure, with or without cause. But if he idopts that course he is liable to repay her dower. A divorce by khoola is a divorce with the consent and at the instance of the wife. In such a case the terms of settlement are a matter of arrangement between the spouses and the wife may as a consideration, relinquish her mehr and other rights. But since the wife has not admitted to the khoola, it does not constitute a divorce. The divorce was effected through the husband's repudiation of the wife. Hence he was bound to pay his mehr dues

In the second case a Muslim widow with five children. Shamsoonnisa Begam 25 inherited a large share of her father's property in November. 1847. A few months prior to this in May 1847 she married Mot chee Buzloor Ruheem. Due to ill freatment, an December, 1855 she left her husband. But the husband retained the government securities which she had inherited from her father. So in April. 1856 she filed for recovery of her property. In retaliation, the husband, filed, for restitution of conjugal rights.

The husband's sent for restitution was dismissed by the trial court and the high court. The wife obtained a decree in her tayour regarding the property detained by her husband valued at Rs 2,34,800. The

husband appealed against both the orders to the privy council.

During litigation, the husband claimed that he had purchased the securities from the wife and she had spent the amount for the marriages of her children from previous marriage. But the husband was already in debt and a decree was passed against him for a sum of Rs 2,48,000. The documents concerning the securities were traced in the hands of the husband's creditors.

The privy council while upholding the wife's claim of property held as follows: "The wife came to her husband's house as a wealthy woman and left as a destitute. As a Muslim woman of rank, she was in Zenanah and had passed the securities to her husband who was supposed to have managed them for her for the purpose of collecting interest. Instead he had transferred them to his creditors. Her communication to the outside world was from behind the Purdah. Due to her state of seclusion (i.e., Purdah-nusheen) her husband, who managed her affairs for her, was in a position to use undue influence on her".

Regarding the right of Muslim women upon marriage the privy council commented: "Distinction must be drawn between the rights of a Mahmmodan and a Hindu woman and in all that concerns her power over her property, the former is, by law, far more independent, in fact even more independent than an English woman. There is no doubt that a Mussulman woman when married retains her dominion over her own property and is free from the control of her husband in its disposition. The Mohammedan law is more favourable than the Hindu law to women and their rights and does not insist on their dependence upon and subject to the stronger sex".

The third case concerns a marriage agreement. At the time of the marriage Poonoo Bibi's 4 husband entered into the following agreement with his wife: "That I shall never give you trouble in feeding and clothing you; that I shall make over to you and nobody else besides you whatever I shall draw from employment, that I shall never exercise any violence on you; that I shall not take you anywhere else away from your home; I shall not marry or make nikah without your permission; that I shall do nothing without your permission; and if I do anything without your permission you will be at liberty to divorce me and realise from me the amount of dynmohur forthwith and this nikah will then be null and void".

After desertion, the wife filed for the enforcement of the agreement regarding the husband's savings. The husband was employed in a clerical post and was drawing a salary of Rs 40 and had savings of around Rs 568. The husband's advocate argued that the agreement is against public policy

as it amounts to reducing the husband to a slave. During litigation a compromise was arrived at and the wife agreed to a monthly maintenance of Rs 10. Although, the court commented, "Some part of the agreement may be void", it did not strike down the agreement as invalidor against public policy.

The law of marriage is not a law concerning sexuality or morality. The law of marriage in its essence, like all civil laws, is a law regulating economic transactions, and more specifically, women's access to and control over it. The Islamic provisions of mehr and marriage agreements, and right of property management have stood Muslim women in good stead during litigation in the last century. Hence, the decline from Luteefutoon-Nissa and Shamsoonnisa Began in 1860 to Shahbano Began in 1985, is not a reflection of the Islamic law of marriage, but a sad comment on the politicisation of women's rights within a communally vitiated and patriarchally tilted social structure.

# **Cultural Intervention and the Left**

# Sahmat Model of Cultural Activism

S M Menon

THE upsurge of Hindutva deeply unsettled all the more comfortable assumptions about the character of politics in India. It was a campaign that ran along several planes—social political and cultural offensives often blending seamlessly. The rhetoric of Hindutva today does not, perhaps, carry the arrogance of those days or bristle with the same kind of aggression. But that does not mean the menace has abated. The extreme rhetoric of cultural exclusion that Hindutva patented is being continually honed for deployment at a future date of convenience.

Rosy prognoses of the end of the cor imunal threat may be unduly optimistic. But there is little doubt that the juggernaut has faltered in its onward march. This is an outcome primarily of the strength of the political challenge to communalism - the process of building social coalitions of those excluded from the ambience of cultural nationalism, and the translation of this solidarity into an electoral plurality. Hindutya emerged from the interstices of a liberal democracy and threatened to demolish its very foundations The challenge to it emerged from the same broad milieu, utilising the liberties and privileges afforded by it to beat back the menace, strengthening in the process the participative basis of a liberal democracy

The role played by ideological and cultural intervention in the secular counter offensive cannot be underestimated. A variety of initiatives contributed all of them working towards, the rejection of the exclusivist cultural paradigm posited by Hindutva. Two broad lines of approach were discernible in the cultural challenge to Hindutva, one which sought to establish cultural nationalism as a lineal descendant of the legitimising ideologies of easte privilege, the other which counterposed a model of inclusion, tole tance and assimilation as the fundamental principles of Indian cultural evolution.

The overarching parameters of these cultural interventions were provided by the relative unity of purpose achieved by the forces which stood for upholding the diversity and plurality of Indian traditions against the homogenising vision of Hindutva. That sense of mutual solidarity has survived great adversity and been institution ilised in recent times in the United Front government that today is in office.

Competitive radicalism, the effort to draw fine shades of distinction in political virtue and the 'more revolutionary than thou' posture which have often undermined the unity of progressive political mobilisation – all these were set aside as the Hindutva phenomenon acquired its most menacing dimensions in the months following the Ayodhya demolition. That this divisive tendency should resurface now when the threatis on low key is understandable, though that does not make it a welcome development. Nor is triviality rendered protound by calling upon the authority of the hero of Bolshevism Impassivity of response and inflexibility of attitude were no part of the strategy of the architect of the Russian revolution.

Political activity—even as cultural intervention—hastobesensitive to its context. The principles of political activity evoived by Bolshevism in the context of clandestine activity in the despotic. Is anist regime are of immense strategic value for any party committed to socialism. But their mechanical application to a noninnally democratic regime which maintains the institutions and processes of liberalism may be a less than useful procedure.

The onward march of Hinduts a had multiple and diverse facets. The common underlying theme was the ab indonment of all presence of commitment to a democratic ethos—the nominal adherence to the principle of equality before the law was ejected and the appeal to preternatural faith rather than reason consecrated as the central political virtue implicated in the process were the institutions of democracy itself—organs of the state like the civil administration—the police and the judiciary. Neither was the media—whether regarded as the fourth estate, the watchdog or conscience keeper—tree of the infection.

Nothing escaped the grasp of Hindutva For those who were sensitive to such subtleties, the public mood after the Ayodhya demolition was an amalgam of several sentiments. Mingling with the sense of shock and outrage that all with a commitment to secularism felt was the unstated triumphalism of even some of the uncommitted—the sense of fulfillment that an alien cultural presence which had diluted and even subverted the primordial id nitty of the Hindu nation had been given notice of eviction.

The micsage of the Ayodhya aftermath was clear enough for anybody to grasp. But since memorics are short some of the more disturbing episodes bear recapitulation – the disproportionate use of force against Muslim protestors, the ruling of the Allahabad High Courton Lord Ram's status as a constitutional entity, on the basis of which devotees were

permitted to offer prayer at the shrine erected on the ruins of the mosque, effectively legitimising the demolition

But if these events called for some interpretative effort, the Bombay riots of January 1993 imposed no such requirements For close to a week, moters held the city in their thrall, with the active assistance of the custodians of law and order. And as a contender for influence in the underworld blazoned across the pages of his newspaper his arrant disregard of the law, mutting his brutalised flock to wreak a horrible vengeance on the Muslim community, the mass media chose the path of extreme prudence. For the entire duration of the riots. Bal Thackeray's fulminations passed without comment by most major newspapers. More than appeasement, it was a policy of abetment through a sustained conspiracy of silence

More than the lives and fivelihoods of an entire religious community, their claim to a place under the Indian sun—which are worth endless political struggle to safeguard—what was at stake then was the integrity-of the democratic institutions that had been crafted over four decades of independence, the central republican values themselves

To say that this subversion of the administration is a necessary outcome of the politics of a repressive state is a credible argument. But it is of little political utility in a context v high demands the participation of socialist parties in the nominally democratic processes of a bourgeois state The shrinkage of whatever democratic space is available helps nobody unless the correlative argument is advanced. That liberal democratic pretensions must be ruthlessly done away with, that the socialist project will really gather momentum only in the struggle against naked despotism. Under this rationalisation, parliamentary illusions are the enemy of socialist struggle, whose true glory would only emerge under the repression of an overtly anti-democratic regime

These are arguments that have periodically surfaced in left circles by are now considered with some justice to represent a variety of political infantilism. Mature consideration would seem to pose two questions for consideration is the octalist revolutionary project in any way compromised by a defence of the democratic secular space? Can the two coexist in a relationship of logical (and temporal) sequence or of inclusion of one within the other? The alternative to answering these questions with the seriousness they deserve would be to adopt the traditional healing inform of the witch doctor—that matters must be aggravated before they can be improved.

An appropriate trictal perspective for the left would emerge as a derivitive of these questions. The fundamental issue here is the attitude to be adopted to the institutions of

liberal democracy. There is the option of turning one's back on these on the grounds that the rights they safeguard are entirely superficial, that at their core they serve only to defend an oppressive order that has little in common with the socialist vision. But in a context when even the nominal rights enshrined by these institutions are under threat, such an attitude would perhaps be suicidal. The choice in such circumstances would be unequivocal — to fight for the defence of these institutions, to correct when necessary and influence when possible.

The Indian press adopted the most unheroic attitude towards the upsurge of Hindutva. Worse than acquiescence, it actively campaigned for the country's subordination in world councils to the imperialist cabal of the IMF, the World Bank and GATT. The judiciary similarly was often in error and sometimes remiss in its attitude towards these pivotal political issues. Yet nobody has argued that the left should disengage itself from these institutions. Political activism cannot be renounced in an unending vigil over socialist purity.

As an institution, the police have their own assigned function in the liberal order. They carry the guns that kill and wield the lathis that maim. The coercive functions of the judiciary and the media have the quality of abstraction about them—police repression has an immediacy, a clarity and an unmistakable brutality about it. But it does not follow from this that the police as an institution and as a collectivity of individuals are unamenable to correction and impermeable to political influence.

A government that proves unwilling to defend the liberal principles on the basis of which it is constituted forfeits the right to rule. But the right of recall is not constitutionally mandated in India or for that matter in any contemporary democracy. For better or worse, a government elected to office can without making too fine a point of scruples continue in authority for a five year term. However, it is unusual in a multicentred polity such as India's for an entire government to uniformly lose credibility and popular legitimacy. This is partly because of the enduring influence of certain of the foundational principles of Indian democracy. The government may waver in the practical sense in the defence of these principles. But it is seldom that it will repudiate them at the ideological level.

It is not outlandish to argue that this represents an opportunity for those who believe that the defence of these principles – secularism being one – is fundamental to the survival of Indian democracy. If funding is available from the government for activities directed towards this end, there seems no apparent basis to imagine that the money is tainted. Such an argument would lead to the perfectly bizaire conclusion that all intellectual and cultural activity funded by

a government that is less than pure is inherently compromised.

Nor is it easy to discern an argument in Gandhi that any activity bears the stigma of the source that finances it. The Mahatma partook with little reserve of the finances of GD Birla and Jamnalal Bajaj, who had built their fortunes in the colonial trade. There could not have been, for an anti-colonial fighter, a more tainted source. But in the circumstances, there could not have been a more robust approach to a defined political goal.

# Aba-oa and Gender Equations among Garos

# Bela Malik

THIS response to Bina Agarwal's comments (EPW, June 8, pp 1417-20) on Indu Agnihotri's review of A Field of One's Own: Gender and Land Rights in South Asia (EPW, March 8) stems from my own doctoral research in the Garo Hills region. I disagree with her claim that her analysis was based on "available archival material in English (there wasn't much, and I doubt much more could be dug up in English)..." (p 1418). Given the broad scope of her work, it was perhaps not possible for her to explore the existing range of arhival sources (in English), but that does not mean that it is not there. Even after four years of research, archival and field-based, I would hesitate to claim that my use of written sources was exhaustive. Apart from records of the various government departments at the national, state and district-level archives and record rooms, there is a wealth of material in the tribal research institutes, church record rooms and the district council record room.

I argue that Agarwal's meagre use of primary historical material had led to a skewed understanding of the impulse leading to the transformation of the shifting cultivating community in the Garo Hills. Let alone primary, even a glance at the expansive secondary literature on shifting cultivation would have drawn attention to the shifting cultivation production system itself and away from emphasis on property structures in relation to the state as explanation for systemic transformations.

While there can be little dispute about the manner in which Agarwal chronicles gender equations among the Garos, what is contestable is the identification of the state (both colonial and post-colonial) as the primary agent of change (laws, projects, scarcity of land due to government initiatives and so on). Such a focus renders other pro-cesses, emanating from within the agricul-tural system, marginal.

Shifting cultivation is a very fragile system which can be set off on a continuously downward spiral by the alteration of any of its variables (do nographic or ecological). The role of an externally constraining agent may not be significant. In any case, mere qualitative assertions that the transformation of shifting cultivation was induced by state initiatives cannot suffice. Agarwal, as a trained economist, cannot ignore the significance of quantitative evidence: land area under shifting cultivation, demographic changes and the proportion of land under direct state

control. In the post-1955 period, often statesponsored schemes have worked successfully in those areas where shifting cultivation has reached a sub-optimal level and the cultivators have been keen to accept any available alternative to, or supplement for, shifting cultivation. That the state's Soil Conservation Department has an image far different from its coercive forest counterpart is significant.

Further, Agarwal has failed to grasp the importance of the current political configuration obtaining in the autonomous hill districts of north-east India. Laws restricting shifting cultivation do not translate into political reality, neither is state control in the district council areas absolute. In the Garo Hills, for example, shifting cultivation comes under the 'unclassed forest area', which is the responsibility of the district council, not of the state forest department. The elected representatives of the district council ensure that the laws relating to shifting cultivation are more notional than real. It is surprising that Agarwal identifies legal statutes as the primary agent of change in this instance, given that her overall thesis in A Field of One's Own is that mere legal gestures cannot altr. gender equations.

I also question Agarwal's construction of binaries: *jhum*, animist, subsistence vs wetrice, Christian and cash-based [Agarwal 1994: Table 4.1, p 167] as unrealistic. There are innumerable Garos practising *jhum* (incidentally called *aba-oa* in the area) who are linked to the cash economy and are Christian.

Finally, I cannot help wondering if Agarwal has not uncritically generalised the conclusions reached by Kibriaul Khaleque (1983). The case of the Garos of Bangladesh studied by Khaleque is unique in at least two crucial respects:

(1) In the regional political economy of district Tangail, (East Pakistan or Bangladesh), the Garos are a marginal group.

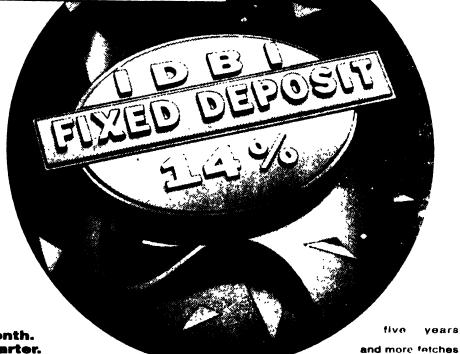

(2) The specific focus of Khaleque's study is the Madhupur Garh Reserved Forest, where the marginalised and dominated aspect of the Garos is accentuated.

WITH over five years behind us since the initiation of the so-called economic reforms programme we have a fairly clear view of its consequences. Signs of a slowing down are now clear in almost every sphere of macro le el performance of the economy For a while there were indications that some of the ground lost in the initial years of the retorms had been recovered in the subsequent two years but doubts have emerged about the sustainability of the higher growth Real GDP growth, which had dipped to 0.8 per cent in 1991-92, the first year of reforms and was 5 per cent in each of the next two years improved to 6 3 per cent in 1994-95 and possibly to 6.2 per cent in 1995-96. The CSO had carlier revise lits advance estimate of GDP growth in 1995-96 from 6.2 per cent to a robust 7 per cent and forecast a growth of 6 6 per cent for 1996 97 Both these projections seemed rather stretched and the CSO has now restored the original 6.2 per cent growth estimate for 1995-96

Should Domestic Prices Be Lquated

to World Prices?

Prabhat Patnaik

The CSO's forecast of 6 6 per cent growth of GDP in 1996-97 is predicated on

acceleration of growth in the services sector from 7 per cent in 1995 96 to 8 1 per cent apart from 2-3 per cent growth in agriculture and allied activities and 8.5 per cent growth in industry. While the satisfactory runfall situation does portend an improvement in crop output there are definite indications of a slow down in industrial activity in general and in infrastructure industries in particular The growth of industry and services in 1994 95 and 1995 96 was to a great extent supported by the rise in fiscal deficit by sizeable injection of external liquidity and by repression of administered prices and costs. The portents in these respects for 1996-97 are far from hopeful and the overall growth of GDP this year is likely to be less than 6 per cent. Investible funds available for industry have shrunk and interest rates have gone up sharply, as a result of which the implementation of many major projects in both the public and private sectors has been delayed. The government has been forced to effect hetty increases in the administered prices of petroleum products and some other price increases are in the offing. The annual rate of inflation as per the wholesale price index has is a result moved up from 4.2 per cent to 6.7 per cent. If expenditure compression continues to be the mainstay of fisc if adjustment, with the total expenditure of the central and state governments together falling steadily from 30.6 per cent of GDP in 1990-91 to 28.5 per cent in 1995-96 and further to 27.3 per cent in 1996-97 (budget). The decline is expected to gather pace in 1996-97, whether we consider the ratio of total development expanditure to GDP or that of capital expenditure or plan expenditure to aggregate expenditure.

I fliciency and I quity in Indian

Urbanisation

2499

That industrial growth is flattening out is evident from a number of indicators. The rise in the index of industrial production which had dipped to 0.6 per cent in 1991-92 and 2.3 per cent in 1992-93, recovered to 6 per cent in 1993-94 and accelerated to 9.4 per cent in 1994-95 and 12.1 per cent in 1995-96. In the first quarter of 1996-97 however, the CSO's index of industrial production showed a rise of only 8.5 per cent compared with 14.6 per cent in the first quarter last year. The growth of production

2565

in industries accounting for 50.37 per cent or the total weight in the general index was 12.5% of per cent against 12.6 per cent in the are repord last year. The sharpest fall has section infrastructure industries. Crude oil conduction has registered a tall of 10.4 per and the trist quarter of this year against a is all 19 per cent in the corresponding eath last year. The decline in the growth power generation has been from 11.7 per coa to 2 4 per cent. The major infrastructure industries had already experienced a deceleration in 1905-96, which should have 4) impact on industrial growth in 1996-97 It maistrial growth in 1996-97 does slow fev is as seems very likely, the ground lost in the industrial sector in the immediate offering and structural adjustment is unlikely 30 to a been fully recovered and so the association of schaim that the reforms have rives a decisive boost to industrial growth would be clearly unwarranted

Not is the claim that the improvement in sociall GDP growth performance is action table to the improved performance of adastry following economic liberalisation nable. Over the period of the reforms, oculture has made a significant con-Obstrong to GDP growth. Growth of Grop prodestion averaged. Uper cent per annum between 1992-95 and 1994 95 despite the icknowledged slowing down of investment in agriculture. The strong backward and forward linkages of nine continuous years of good agricultural seasons (from 1988-89) to 1996-97) which have kept the production of major crops on a high plateau, must have been very substantial. In fact the stabilisation and structural adjustment programmes have, if anything, come in the way of the economy benefiting fully from the high agricultural growth. Real investment in agriculture had begun to flag in the early 1980s. Though there occurred a fractional improvement in the early 1990s, this was essentially the result of rise in private investment in response to successive good agricultural years. Average public sector investment in agriculture at 1980/81 prices in the three-year period 1991/92 to 1993/94 at Rs 1,080 crore was about 12 per cent lower than in the preceding three-y to period from 1988-89 to 1990-91. s a Rs (24 crore). During the same period, gravate investment in agriculture registered a 29.4 per cent rise. Also unsubstantiated is the government's claim that reform of customs tariffs, liberalisation of domestic and international trade and easing of exchange control have substantially reduced the bias against agriculture, improved its relative probbability and the incentives as utable for farmers. True, 5.6 mn tonnes of tice were exported in 1995/96, but the primary reason for the improvement in the terms of trade for agriculture (base  $\pm 969-72\pm 100$ ) by about 10 per cent between (99) 91 and 1995/96 was the large increase in procurement and minimum support prices of foodgrains. Between 1990-91 and 1995-96, the procurement price of common

varieties of rice was raised by 75.6 per cent and that of wheat by 69 per cent. Minimum prices of pulses and many other crops were raised even more.

Export-import data too reflect signs of slowing down of economic activity. Annual export growth, which had accelerated to about 18-21 per cent during 1993-94 to 1995-96 from 3.8 per cent in 1992-93 and (-)1 5 per cent in 1991-92, has come down sharply in the first five months of the current year to 8.9 per cent against a rise of 26.2 per cent in the corresponding period of last year. The target of 20 per cent growth in exports in 1996-97 now seems far-tetched, Non-POL imports too have experienced a fall of 4.7 per cent against a rise of 42.3 per cent during April-August last year. The reduced growth of about 24 per cent in the first quarter of 1996 97 (against 56 per cent in the comparable quarter of 1995-96) in import of machinery and the decline of 6 per cent (against a rise of 53 per cent last year) in in.port of chemicals obviously reflect the slow down in industrial activity.

The relatively impressive performance of the economy in the last two years has thus turned out to be a short-term phenomenon attributable to some specific factors rather than a sustainable outcome of the reforms The high level of agricultural output with substantial spread effects, massive injection of liquidity from abroad in 1993-94 and 1994-95 through portfolio inflows, the higher levels of gross fiscal deficit than planned which augmented aggregate demand in the economy and the rapid increases in the volume of world trade which helped export growth were some of the immediate factors which played a role in improving the performance of the economy in the past few years. Developments in the current year, however, show that, in the absence of some of these factors, growth is sagging and there are few signs of enduring improvement.

This is not surprising because the basic conditions for the success of the reforms have not been fulfilled. Land reforms have hardly been mentioned and instead there has been talk of doing away with land ceilings and permitting, directly or indirectly, largescale corporate farming. The focus of the reform package has been on customs tariffs, trade policy and the exchange rate mechanism which by reducing protection for the industrial sector is supposed to correct the e-stwhile bias against agriculture, but institutional disabilities and the absence of incentives for intensive cultivation and rapid increases in productivity of land remain unaddressed. Likewise, the issues of stre-gthening the social intrastructure, enlargement of human capital and amelioration of acute social deprivation have received scant attention in the reform programme. According to the UNDP's Human Development Reports, India's rank out of some 172 or 173 countries remained static at a low 134, 135, 135 and 135, respectively, in the four years from 1990 to 1993. Many countries of south-east and east Asia have moved up the ladder. The performance in respect of such basic social indicators as literacy, infant mortality and crude birth and death rates in the post-reform period has been below the long-term trend, not surprisingly as public expenditures carmarked for the social sectors, already niggardly, have been declining as a proportion of GDP. Social expenditure, inclusive of that for rural development and the special employment schemes, as a percentage of GDP was 7.7 per cent in 1990-91 and 7.5 per cent in 1996-97. Exclusive of rural development and the special employment schemes, the proportion fell from 6.2 per cent in 1990-91 to 5.8 per cent in 1996-97.

Data on poverty also suggest a deterioration, particularly in the rural sector One set of estimates available in this respect, based on the widely accepted NSSO method. indicates that the percentage of rural poverty which was 39.1 per cent in 1987-88 fell to 33.7 per cent in 1989-90 but rose thereafter to 35 per cent in 1990-91 and to 41.7 per cent in 1992; it registered a fractional fall to 40.2 per cent in 1993-94. Another data set shows that the number of rural people below the poverty line increased from 209 mn in 1989-90 to 245 mn in 1993-94. Available data also suggest that real wages of unskilled workers tell in 1994-95 after showing a rise in 1993-94 - apparently the outcome of the steep increase in issue prices of grains under the public distribution system. In general, the rapid increases in prices of food articles in the period 1990-91 to 1994-95 have adversely affected the real consumption of the poor This deterioration in the poverty situation in real areas has occurred despite significant increases in agricultural output The benefits of output increases have not been translated into reduction in poverty levels. Studies based on the latest NSS data for 1993-94 also show that (a) the rate of growth of non-agricultural employment, particularly in rural areas, has slowed down, (b) agricultural employment growth was negative in states like Punjab, Haryana, UP and West Bengal, where agricul ural output grew the fastest, and (c) most of the increase in agricultural employment in the postreform period has been distress driven.

The prevailing acute social deprivation demanded a dynamic application of the fiscal instrument, whereas the government has chosen to follow a conventional fiscal adjustment programme of surrendering tax revenues, expenditure compression and large net market borrowings. Whereas overall public expenditure has been curtailed and plan outlays and capital expenditures have been reined in, budgetary allocations have not been significantly altered to focus on any definite social priorities. The scope for such reallocation has been severely restricted by the fact that nearly 60 per cent of the central government's aggregate expenditure is absorbed by four major heads of non-plan expenditure, namely, interest payments, defence, subsidies and general services. Since the reform process began, some 70 per cent of the rise in expenditure under these tour heads has been accounted for by interest payments—thanks to the policy of market-related rates of interest on government debt under the financial sector reform programme.

In general, fiscal adjustment has not only turned out to be the most conspicuous fadure of the reforms, but its wayward maplementation has led to many economic and financial distortions. With so much scope for raising the tax to GDP ratio, the government has managed to reduce it further Similarly, though there is imperative need to raise public expenditure as a proportion of GDP to build the physical and social infrastructure, the government has resorted to large-scale expenditure compression There are many countries with public expenditures exceeding 50 per cent of GDP but here the total expenditure of the central and state governments, which stood at 30.6 per cent of GDP in 1990-91, had been scaled down to 27.3 per cent by 1996-97 (budget) The cuts have been entirely in capital and development expenditures, whereas revenue expenditure and overall non-development expenditure have been allowed to grow unabated. As a result, compared to an average of 2.5 per cent of GDP in the 1980s, the revenue deficit has generally remained above 3 per cent in the post-reform period and even touched 4 per cent in 1993-94. One of the avowed objectives of reform should have been to direct public expenditure towards augmenting the stock of productive physical and human capital. On the contrary, both capital formation out of public expenditure and funds earmarked for social infrastructure have suffered a setback. A major destabilising fall out of distorted fiscal adjustment in the past six years has been the massive borrowing requirements of the government giving rise to a situation, almost for the first time, of the government crowd ing out private investment both by appropriating large investible funds and by push ing up the average interest rate on commercial borrowings of the corporate sector

Signs of vulnerability have reappeared in the external sector as well. There has been a phenomenal rise in the deficit on merchandise account - as per the RBI's balance of payments data, from \$ 2.39 bn in 1993-94 to \$ 4.98 bn in 1994-95 and \$ 8.94 bn in 1995-96. These high levels of trade deficit have been hidden by the low level of reporting by the DGCI and S which placed the deficits at \$ 1.07 bn, \$ 2.32 bn and \$ 4.54 bn. respectively. Likewise, the current account deficit has more than doubled from \$ 2.70 bn in 1994-95 to \$ 5.49 bn in 1995-96. Apait from the reduced export growth as indicated above, external sector vulnerability arises from volatility of capital flows, particularly those relating to portfolio investment and their servicing costs. Also, the argument that in external sector budgeting, the cost of non-debt flows should not worry the government is a specious one. In fact portfolio investors in particular expect shorter-term and higher rates of return on their investments in the so-called emerging markets such as India.

A longer term aspect of the vulnerability, however, relates to the nature of FDI flow A quick assessment suggests that (a) while the RBI's automatic clearances based on past FERA rules show a preference for high technology areas with distinct concentration in basic and capital goods industries, the approvals granted by the Foreign Investment Promotion Board/Secretariat for Industrial Approvals seem to have gone in favour of low priority areas with a concentration in consumer goods and the services sector, (b) foreign investors overwhelmingly prefer to focus on the domestic market rather than regard India as an export base; (c) a large number of the FDI proposals approved involve trading activities; and (d) an overwhelming number of the FIPR/SIA approvals envisage puny foreign equity participation, thus requiring substantial amounts of domestic investible funds for completing the projects. Measured in these terms, it is unlikely that FDI proposals as approved by the FIPB/SIA route will trigger a significant investment boom in the country or serve as vehicles for expanding the country's export base or for any marked technological upgradation

The reform process has faced the sharpest adverse reactions in the financial system This is not altogether surprising. In the first place, the financial system has to absorb the shocks originating in the real sectors of the economy. The promotion of conspicuous consumption and the consequent depression of household financial savings, liberal import of gold and silver, persistence of large revenue and tiscal deficits of the central government necessitating large market borrowings, the ebb and flow of volatile and high-cost foreign portfolio investment, the continued fragility of the balance of payments and the determination of the rupee's exchange rate by market forces, are all developments that are mirrored in the working of the financial system. Secondly, the financial policies of the government and the developments within the financial system have made their own contribution to the system's distortions and uncertainties

The government has shown scant regard for the fundamental fact that market failures are most pervasive in the financial sector and that, as the experience of the south-cast Asian countries has shown, flexible but firm government intervention will not only make these markets function better but will also improve the performance of the economy. At this stage of the country's development, the considerations that should have governed financial policies are (i) further strengthening of the geographical spread and the functional reach of banks and financial institutions. (ii)

special focus on the multi-agency approach to rural banking which has plunged into disarray by default, (iii) active intervention to ensure that large enterprises, real estate speculators, stock brokers and upper class consumers do not pre-empt scarce credit and that banks and financial institutions actively assist agriculture and small enterprises, and (iv) prevention of excessive financial engineering with layers of financial dealings and special tion in the money, capital and foreign exeninge markets, which can only be counter-productive and harmful. The very perspective of financial sector retorm and the entire series of measures taken have gone against these essential considerations Instead of focusing on a genuine revitalisation of the existing commercial and co-operative banking system as a least cost and socially desirable option, the government has sought to raise banking efficiency by the proxy method of promoting competition from new private banks, foreign banks and now private rural banks. A series of measures have been taken to dilute the importance of public sector institutions

Whether it concerns the efficient functioning of the financial system or more rapid growth of the economy, the severest constraint faced by the Indian economy has been the relative stagnation of domestic saving and investment. All aspects of the new economic policy, including sharp reductions in excise and customs duties import of gold and silver, encouragement to banks to give consumer toans and the general environment of large increases in consumption based perquisites spawned by liberalisation have tended to further stimulate the already high consumption propensity of the richer sections of the community Therefore, despite an improvement in the growth rate and very high levels of real interest rates combined with attractive fiscal incentives, the household financial savings ratio has shown a dip in 1995, 96 and 1996/97. It has been found that whenever household financial savings rise as a proportion of personal disposable income there is a bloating of liquidity arising from some external source such as, for example foreign inward remittances from Indianexpatriates abroad doring the 1970 or portfolio investment flows in 1993-94 and 1994-95 Endogenous growth of household saving has been niggardly

Among the components of dome to saving, corporate savings, which played a dominant role in the economic growth of Japan. South Korea and other east Asian countries, have shown some uptrend in recent years, but much of it has been the result of treasury operations and non-manufacturing profits and sharp reduction of taxes. There is no indication that a rising trend has actually set in, though that would also depend on whether a firm uptrend in industrial growth has been established. Besides, Indian companies, increasing dependence on the volatile capital mark. If or

funds does not allow them to plan for larger plough backs. As for the public sector, any attempt to reduce subsidies and other transfer payments may raise government savings, but to some extent that would be at the cost of household savings. (A ready example is the recent increases in petroleum product prices which may reduce the deficit in the oil pool account but would affect household expenditure and savings.)

The experience of the last six years has shown that orthodox stabilisation and structural adjustment programmes do not constitute a relevant strategy for the Indian economy. Yet it is perhaps unrealistic to expect the government to take a fresh look at the whole strategy. But there are certain imperatives. One such is social sector development - universal primary education, primary health infrastructure and essential rural and urban facilities. This calls for decentralised and participatory local governance. Increased public sector involvement in development of social and physical infrastructure is another imperative. The investment requirements of power, ports, roads, railways, posts and communications and other infrastructure will not be forthcoming from the private sector and from foreign capital. The public sector will continue to have to play a dominant role in these areas.

Banking and financial sector reforms have, as noted above, contributed to major distortions in the economy. As a primary consideration, financial sector policies will have to accept the dynamic role of credit in industrialisation and agricultural development. In monetary policy, the pursuit of price stability through monetary control and the use of indirect monetary instruments will have to give way to a renewed focus on bank credit and the deployment of direct instruments of monetary control, including regulation of the amount and distribution of bank credit, stipulation of interest rates and the prescription of sector-specific refinance facilities. In the context of the diversification of financial markets, even in the developed countries considerable attention is now being paid to the direct effects of monetary policy not only on prices but also on output and employment. Guidelines on credit distribution, which can be evolved in a nonbureaucratic manner, must involve disincentives for bank credit flowing to real estates, company shares and consumer durables. To encourage banks and financial institutions to focus on production credit, they should be given flexibility in the application of capital adequacy norms. This will also obviate the need for them to compete with manufacturing firms for equity and debt capital in the market.

To bring down real rates of interest from their present very high levels, a system of interest rate regulation together with quantitative guidelines on the distribution of bank credit has to be put in place. For some years to come, till the financial system acquires competitive strength and the informal sector of the economy achieves a degree of resilience, the erstwhile arrangement of prescribing minimum and maximum lending rates for different categories of borrowers is the only viable strategy. The argument that small borrowers anyway pay usurious rates of interest to informal credit agencies and hence can bear high rates of interest on their borrowings from banks and financial institutions is spurious. Apart from the question of equity which demands a progressive structure of interest rates, it is pertinent to ask, if small units and informal sector borrowers can be expected to put up with very high rates of interest, why not organised sector units?

Despite the reduction in inflation rate, the interest rate on bank deposits up to one year has been kept at 11 per cent and deposits of higher maturities have been freed from interest rate regulation. Rates on bank deposits and similar saving instruments have shot up as a result. Competition among banks has been intensified further by the liberalisation of deposit rates of RBIregistered and credit-rated non-banking finance companies (NBFCs). This will prevent interest rates from coming down even if the liquidity strain is eased. The flow of funds to real estate, company shares and consumer durables will also be further encouraged. It is now well accepted that high interest rates do not augment overall domestic saving, but only shift saving from one instrument to another. A clear distinction between short-term and long-term deposits would have helped to reduce banks' cost of funds, the benefits of which could have been passed on to borrowers, particularly the small and medium ones.

The system of regulation and prescription of minimum and maximum rates needs to be extended to the inter-bank overnight and call money market. Even in many advanced countries, call rates are either targeted or prescribed from time to time by the monetary authorities. Given the structure of the banking industry here, self-discipline is unlikely to work. So it is necessary for the RBI to intervene and prescribe a range of, say, 12 to 25 per cent for overnight call money borrowing (linked to some notion of average cost of deposits to banks at the margin at the one end and a realistic ceiling rate on bank advances at the other). A minimum rate of 10 per cent on call money borrowing is justified to curb lending by lowdeposit-base banks and prevent serious liability-asset mismatches as a result of excessive dependence on the call money market. Call money rates beyond 25 per cent should be considered a sign of the system's weakness and a source of destabilisation. The permission granted to term-lending institutions, mutual funds and other financial institutions to lend in the overnight money market has already done considerable harm

by making for free flow of funds between the money market and the capital market. It has also come in the way of effective transmission of monetary policy impulses by encouraging banks to carry mismatches between assets and liabilities. So FIs definitely need to be pulled out of the overnight call money market. The system of auctioning dated government securities has resulted in their yield rates being pushed up to very high levels. Already the RBI has been forced to revert to the earlier system of predetermined coupon rates on dated government paper. This must become part of regular policy so that false expectations on government bond rates are not generated.

Banks must be required to strictly enforce the end-use of credit. Banks need to effectively use the Tandon and Chore Committee norms on current assets and derive permissible bank finance after excluding treasury operations and financial investments, such as in finance companies, associate companies, shares of other companies and the inter-corporate deposit market. The current framework of monetary policy has stimulated expectations of usurious rates of interest on banks' assets, thus jeopardising growth. It has also ensured that the interest burden on the government is so heavy that there will be no end to the fiscal crisis. The RBI's steadfast refusal to focus on credit as a policy target and to render sector specific refinance and rediscount facilities for such areas as agriculture, small-scale industries and other small borrowers - a policy which south-east Asian countries such as South Korea have pursued with great success - has deprived monetary policy of the ability to play an effective role in promoting geographically and sectorally dispersed industrial development. In the context of the elimination industrial controls, some degree of sectoral and regional priorities in industrial investment can be enforced by the lending policies of the financial institutions. Therefore, the earlier policy of the termlending institutions playing a decisive role in industrial development, with the IDBI functioning as the apex institution to evolve policies, set lending prioritics and undertake tasks of co-ordination, should be restored with renewed vigour. For rural credit, the multi-agency approach deserves to be reinforced. The age-old plans for strengthening the co-operative credit structure need to be pursued with vigour. Regional Rural Banks (RRBs) should be delinked from the parent banks and given operational freedom so that they supplement banking services in their areas of operation. At the same time, the role of commercial banks in meeting rural and semi-urban credit needs must be reiterated and, towards that end, the lead bank scheme of individual banks being assigned different districts for special focus needs to be revived with renewed emphasis.

# Role of Planning in a Globalised Economy

Arun Ghosh

The newly-constituted Planning Commission must tackle three crucial areas: (a) widely-spread rural development; (b) raising of domestic resources adequate to meet developmental needs; and (c) ensuring the long-term viability of the balance of payments.

A NEW Planning Commission has been constituted by the UF government as of July 31, with Madhu Dandavate as the deputy chairman. Despite the excellent past credentials of the new deputy chairman, somehow the new commission does not inspire much confidence that its sights are set right, if only because of the st gement made by the chairman of the reconstituted commission at its first meeting on August 19, with focus on the continued pursuit of economic liberalisation policies and of changing the sights of planning in the above context.

Let us, however, reflect on the above point Times change. The world is constantly changing, for technology does not stand still Ideas and ideologies which may have been appropriate in 1950 may not – in fact are not – relevant in 1996. Only a silkworm lives in a cocoon, but its life is brief. We must accept the fact of the world as a sort of 'global village' today, both the modern means of communication and the magnitude (and mobility) of international finance capital have made for a sea-change in the world scenario which any country can ignore at its peril

Do we need to plan at all, in the framework of the process of 'liberalisation' let loose since July 1991 (and therefore pursued for more than five years)? What precisely is the role of planning in a globalised 'market economy' where all investments are supposed to be based on forces of market demand and supply? Even as per the announced policy of the United Front government, the process of 'liberalisation' is to be continued; and the announced policy of the government is to seek the inflow of external capital to the tune of \$ 10 bn annually, in order to bridge the gap between domestic savings and investment needs. The role of the state, implicitly, is to be limited to social sector investments - on education, on health services et al - so that all production of goods and services (for direct consumption or as producer goods/services, including infrastructure) must now be left to the market, for the foreign investor (as indeed his domestic counterpart also) would be motivated only by the criterion of profitability. Today do we really need a Planning Commission? Do we really need to plan? If so, why plan, and plan what? We need greater clarity in regard to both the above aspects of planning, in the context of the present policy framework; in the context of 'globalisation' being an inescapable reality; in the context of the 'universality' of knowledge, of the need to accept and adopt new technologies (in order to raise the productivity of labour) which alone can improve the standards of living of the people. Will planning help, and if so, how?

#### NEED FOR PLANNING

And yet, let us reflect The world today is doubtless a global village. And yet, like a typical Indian village, it is deeply fractured. Iniquities abound, not only by way of highly different levels of development, the iniquities tend to get intensified by the widely disparate firepower of different countries. Like the muscle-power of the hirclings of the upper castes/classes in Indian villages, the firepower, the threats of its use, the actual use of discriminatory trade and other policies by the industrially developed world has tended to perpetuate the 'dependent' (or subaltern) status of the less developed countries of the world. That also is a fact of life.

It is in the above framework of a global world economy, which is yet a deeply fractured world, that India has to consider its economic policy options. To plan or not to plan, what to plan for, are decisions which are crucially dependent on two stark realities (a) the general lack of knowledge and skills, in a large part of the Indian workforce, with (fortunately for the country) a reservoir of immense talent and skills, at diverse levels, both in terms of 'knowledge' per se and skills required for translating knowledge into technology; and (b) the reality of a highly fractured world order, where disparities/iniquities are far greater than even in a typical Indian village and the gap between the 'haves' and the 'have-nots' of the world has been steadily widening; where the developed world is quite clearly intent

on 'exporting' its own unemployment — which exceeds 10 per cent of the workforce in western Europe, and is still around 6 per cent in the US – through the new international economic order which it has succeeded in imposing over the rest of the world through cajolery, threats and on occasion downright aggression.

The above international framework would require skillful manoeuvres on the part of the Indian state; it would require both vision and determination to implement a consistent set of policies vis-a-vis the external world. The domestic social framework would also call for both vision and determination, calculated to systematically overcome the domestic hurdles to widespread economic development. In brief, we need to plan. Naturally, the planning effort has to veer away from some of the earlier tenets of policy. All good remedies depend on the nature of the ailment, and without further ado, it may be useful to underline the three crucial areas which the newly constituted Planning Commission should tackle - and in regard to which the government must accept the overall planning framework, in order to devise appropriate economic policies. These three crucial areas are: (a) widespread rural development, (b) the raising of domestic resources which are adequate to meet developmental needs, and (c) the ensuring of Fing-term viability of the balance of payments, for the long-term threat to India is not political aggression against the country but its economic (and financial) strangulation

#### RURAL DEVELOPMENT

As per the 1991 Census, more than 70 per cent of the Indian population still lives in villages, and 66 per cent of the workforce is engaged in agriculture and allied activities (farming alone accounting for 60 per cent of the workforce)

Unfortunately the focus of economic policies all along - from the Second Plan onwards - has been on rapid industrialisation, and the policy did succeed until the 1970s (despite the great hiccup of 1966, when the focus shifted to urgent attainment of 'food security' based on the green revolution)

But the green revolution has, by now, more or less exhausted itself, and now, suddenly, the focus appears to have shifted to agrarian exports. Every schoolboy knows, however, that the more developed a country, the more its exports tend to be of manufactured products, with significant 'value addition'. The advantage of a large country

with a potential surplus of agricultural products – can be translated into a real advantage only by getting its agricultural

#### PERFORMANCE HIGHLIGHTS FOR THE YEAR 1995-96

- \* The Bank moves to 'A' Category
- \* Operating Profit zooms up by 360%
- \* Net Profit of Rs 11 1 crores is the highest profit ever achieved by the Bank
- \* Total Deposits reaches Rs.5967 crores
- \* Total Advances crosses Rs 2580 crores
- \* Forex Business raises by 104% and turnover exceeds Rs 14930 crores
- \* Credit Card turnover shoots up by 67%, reaches a level of Rs 302 crores
- \* 29 Branches Computerised and 44 partially computerised
- \* Deposit Growth rate above Banking Industry Average
- \* Performance under PMRY Scheme exceeds 101%
- \* Priority Sector Advances reaches Rs.961 crores
- \* Advances to Agricultural Sector stood at Rs 43? crores
- \* Advances to SSI Sector increases to Rs 318 crores
- \*Aggregate Sanction limit under PMRY Scheme is Rs 47 crores
- <sup>4</sup> Advances under 20 point programme Rs 685 crores

#### ALL IN BANKING - BANKING FOR ALL

production attuned to supplying the materials required for the export of manufactures; and that principle applies equally to mineral resources. Exports of primary products have always characterised (colonial) developing countries all through the 19th and the 20th centuries.

There are two other realities to be considered in the context of agrarian development. First, even to this day, only a little more than one-third of the total cultivated area in India has irrigation facilities; and though 'minor irrigation' through the use of subsoil water has been increasing, the water-table has also been going down in many areas. In fact, many experts have expressed deep concern about the future problems of water supply, even to meet the basic problem of drinking water; and the water needs of both irrigation and of industrial development are formidable. The proper planning of 'water use' is a matter which can no longer be ignored, unless we are totally unconcerned about the welfare of the coming generations.

The second stark reality that we must face is that over the years the constant felling of trees (and the denudation of forest cover) both to meet the fuel needs of the population and industrial needs of paper making, furniture, and other wood based products has led to systematic soil erosion and degradation of the countryside in large parts of the country. Of the approximately 140 mn nectares of cultivated area in India, more than 80 mn hectares stand degraded in varying degrees, and some parts of this area are now totally bereft of moisture retention capacity, and therefore fully 'desertified'. With the monsoon in India coming in the form of a torrential downpour over a few months, the top soil tends to get washed away, and even mildly sloping areas have been subjected to such degradation; while the absence of drainage in the areas irrigated with surface water has brought about soil salinity in erstwhile fertile areas in the plains. A minimum of 10 ma hectares are subject to heavy annual flooding. On top of all this, excessive monoculture -especially with high yielding varieties of rice and wheat - has now brought about a situation of 'diminishing returns' in many otherwise fertile tracts, requiring more and more applications of chemical fertilisers and pesticides.

The solution to the emerging problem lies in massive rural works; there is need for an enormous extent of land reshaping, bunding, terracing, the planting of trees (to prevent the sudden rush of waters); the planting of sturdy grasses and other vegetation on steep slopes; the building of small weirs and check dams where the contours of the land may allow such construction — so as to create small, mini-reservoirs for local irrigation — and, finally, to dig drainage channels where

the problem is that of excess water. The above operations would require massive deployment of labour; and the actual works would depend on the topography of each locale. What is required is systematic, local 'watershed area planning', and can be undertaken only locally. In a few isolated areas where such efforts have been made, the results have been striking. The yield and employment potential - have gone up several fold; and new activities, including dairying, other activities, have changed the lives and the outlook of the local populace. (Actual results can be seen, for example, in the Kheda district of Gujarat; in Ralegan Siddi village in Maharashtra; in Panchwati in the UP; in Bandwan Block of Bankura district in West Bengal, to name only a few.)

But local 'watershed area planning' can be attempted only by local communities. What is required is the 'empowerment' of local communities and some means for the funding of the deployment of idle labour in each community. There is nothing new in the idea. The Chinese successfully pursued this methodology from 1950 onwards, so much so that overall labour participation in China increased from 36.1 per cent of the population in 1950 to 49.6 per cent in 1990 (vide, Society and Development in China) and India (eds), Mahadevan, Chi-Hsien Tuan et al, Delhi, 1994, p 371). One need not follow Chinese methods to achieve the same end; the only problem in India that has to be confronted is the pattern of land ownership, and whether and to what extent the landowner or the state should pay for the improvement of the land. But (a) there are common works, common lands, and general improvements (which would benefit all), where the state (or the community) has a role to play; and (b) there are individual holdings where the necessary improvements are partly a function of overall improvement, and partly a matter of making the individual peasant proprietor pay for the improvement of land. In most areas, the size of holding is, in general, so small that the peasant proprietor is a net buyer of foodgrains, and subsists below the poverty line. He cannot be expected to make any payment, except partially through his own labour. Incidentally, Krishna Bharadwaj has tound an inverse relationship between the yield per acre and size of holding in India (vide, Rural Development (ed), John Harriss, 1982. p 287) and in this context land reform (of the type implemented in West Bengal after 1977) would help greatly. But even without fundamental land reform, it is possible to tackle the problem because the size of 'operational holdings' in India is not very large (with the possible exception of Punjab where operational holdings are larger than the ownership pattern would suggest).

Incidentally, to finance the employment of idle labour, one could use the existing surplus food stocks with the FCI; cash requirements can be substantially met if the funds currently earmarked for central and centrally sponsored schemes – of the order of more than Rs 8,600 crore in 1996-97 – can be redeployed for this purpose.

An associated development would be the composting of all village wastes in each village; and this concept could be extended to the use of human excreta – as in China and South Korea – through the construction of communal latrines, of the sulabha shauchalaya type in each village, so that both organic tertilisers and energy in the form of 'methane' is locally available in each village.

But such works can only be taken up at the village level. What is the role of the Planning Commission in the above context? There are three responsibilities that the Planning Commission has in the above context. First, all currently wastefully used central and centrally sponsored schemes need to be mercilessly pruned and phased out, and the funds presently deployed for such schemes earmarked for local communities, to be passed on via the states specifically for local area development plans to be implemented by the panchayats (or similar bodies in the scheduled tribal areas). To the extent that funds earmarked for employment guarantee schemes would henceforth be used simultaneously for employment generation and real capital formation in rural areas, this would lead to an immediate increase in the availability of resources for development. Secondly, the Planning Commission should give up its present focus on the 16 agroclimatic zones (and upwards of a hundred sub-zones) and give up attempts at detailed central planning of agriculture; discourage monoculture; discourage the export of primary products, including foodgrains and raw cotton. (Exports of garments, textiles, even of cotton yarn would have lots more 'value added') The focus, instead, should be on crop rotation, and general selfsufficiency in regard to foodgrains production (where millets and poises would be important constituents) in each area; for, by and large, it should really be only the urban areas that depend on outside food supply, with possibly a few exceptional areas like Kerala, where the topography favours commercial crops rather than foodgrains production. Finally, the Planning Commission should essentially be concerned with price policy, and the tunding of research for agrarian development, with the primary focus on dryland farming techniques and the development of hybrid seeds for such areas.

Briefly, then, the focus on rural development has to be different from the present strategy of 'marketisation' of all agricultural production. Markets are important, but only after a minimum level of food consumption for all has been attained. The present obsession regarding the 'globalisation' of Indian agriculture must be done away with, as a precondition.

#### DEVELOPMENT OF INFRASTRUCTURE AND KEY INTERMEDIATES

The planning of the development of infrastructure as well as of key intermediates must remain the responsibility of the state; and hence must remain a major concern of the Planning Commission. Why is this so? The answer is elementary. Infrastructure costs must be kept down; the adequate availability of infrastructure is a prerequisite to any development. Rural roads; a countrywide network of the road system; an efficient railway system; a modern communications network; the assured availability of power throughout the country (at affordable prices); the availability of other forms of energy; the availability of clean water; other urban infrastructure - all these require state intervention at various levels.

And, to finance such development, resources must be found domestically. This is quite contrary to the present thrust for seeking external capital – to the tune of \$ 10 bn annually – for the required development thrust.

Let us talk in practical terms. How much is \$ 10 bn<sup>9</sup> At the current rate of exchange of the rupee, approximately, Rs 35,000 crore.

If only the State Electricity Boards were to be allowed to charge economic rates of power supplied by them to the rural sector and to domestic consumers, and if the SEBs were to be allowed to get a return of only 3 per cent on their investments - as laid down by law - they would be able to raise resources in the region of Rs 15,000 crore annually. As of 1995-96, the total consumption of power for domestic use was 45,602 million KWH; that of agriculture and urigation was 75,524 million KWH, the two totalling 1,21,126 million KWH out of gross total supply (by the SEBs) of 2,69,761 million KWH, 1 e, 45 per cent of total power supplied by SEBs (vide, Annual Report on the Working of State Electricity Departments, Planning Commission, 1995). The effective subsidy on agricultural consumers alone, in 1995-96, was Rs 11,178 crore (vide, ibid, Annex 4.30). The present talk of privatisation of electricity is therefore based on a lot of disinformation.

Why can we not rely on external capital for such infrastructure? Recent experience has demonstrated that foreign capital has to be guaranteed a minimum return of 16 per cent on capital invested. The actual return on the earlier ENRON project (before substantive renegotiation) as estimated by the IDBI which was providing much of

the rupee finance required for the project – was 16 per cent in the first year of operation, rising to 54 per cent in the seventh year of operation. The return on investment for the revised project may be less (than 54 per cent), but that is wholly irrelevant. The return on the foreign investments being made today still remains much too high.

What is likely to be the increased production (and productivity) generated in the Indian economy, following this investment? Certainly not adequate to service the imported capital, with the result that the savings of the rest of the economy would need to be squeezed in order to service such capital. This is reminiscent of the 'Drain Theory' expounded for 19th century colonial India.

Two other desiderata must also be recounted. Because the ENRON project is based on imported fuel, the World Bank had estimated in 1993 that at peak generation, the outward payment (for capital servicing and for fuel import) for the ENRON project alone would be \$ 900 mn annually, or some Rs 3,150 crore, at 1993 fuel prices. An escalation of fuel costs would push up these figures. Since the power is to be used domestically, additional exports to finance such payments would thereby become an essential requirement.

And, to crown all this, a substantial part of the investment – the local construction costs – is to come from the IDBI, that is, from domestic savings.

That is broadly the pattern of recent foreign investments in India, and of the return expected by foreign investors. And we seem to be gullible enough to believe that infrastructure development can be left to foreign investors. Except for telecommunications and exploitation of known oil reserves – both of which are highly profitable, and for the development of which the C-DOT/MTNL and the ONGC/OIL have the required resources and the expertise – all other infrastructure development requires long-term capital at low rates of return.

But we are not prepared to pay the SEBs even 3 per cent on their invested capital; whereas, we are cheerfully prepared to pay at rates varying between 16 per cent and 54 per cent for power generation capacity developed by external capital.

In brief, external capital on such terms can only be disastrous for the economy. The Planning Commission should draw the attention c' the government to these realities; and put a stop to this drain of India's resources.

RESOURCE RAISING FOR INFRASTRUCTURE
DEVELOPMENT

We have already indicated that a mere 3 per cent return on capital to the SEBs could result in additional resources (i.e., wiping out

current losses plus new resources generated) to the tune of some Rs 15,000 crore annually. (That, plus some funding from financial institutions like the IDBI, should be adequate for power development.) How does one raise the additional Rs 20,000 crore required, if the imported capital of \$ 10 bn is to be dis-pensed with, for infrastructure development?

It is common knowledge that the extant rates of interest in India are absurdly high; in fact, that is one factor that has been bringing in short-term external capital into India. Consider Japan. The Bank Rate in Japan today is 0.5 per cent. The prime lending rate of Japanese banks is 2.5 per cent. Consider India. The Bank Rate has been 12 per cent for some time. The prime lending rates of banks were 18 per cent plus till recently; very recently they have dropped, first to 17 per cent and as of writing to 16 per cent (for some banks). But for most small borrowers the bank lending rate varies from 22 per cent to 25 per cent.

What is the rate of profit that one expects a small producer can earn, that he is expected to pay between 22 and 25 per cent interest on the capital borrowed? This absurd situation has come about because of the World Bank thesis that in a capital short economy, the rate of interest must be kept high in order to discourage capital-intensive methods of production.

The above thesis is wrong for two reasons. First, a high rate of interest does not discourage the displacement of labour by equipment; has not, in fact, done so. Secondly, as Keynes demonstrated as far back as 1936, savings do not depend on the rate of interest; nor is the interest rate an equilibrator between savings and (optimum) investment.

Chintaman Deshmukh, as the first Indian governor of the Reserve Bank of India, announced a cheap money policy – with the return of Treasury paper at 3 per cent – as far back as 1935.

Suppose the government and the RBI were to suddenly bring down the entire structure of interest rates by 5 per cent, what would happen? Nothing untoward would happen. There would be no sudden switch from the

# Economic and Political Weekly

Available from

Sainath Book Centre G-11, Mahendra Chambers V T Magazine Market Dr D N Road Mumbai - 400 001 organised to the unorganised money market; the two are highly differentiated to the unorganised money market; the two are highly differentiated. And, if, to begin with a special tax of 3 per cent were to be levied on all 'rentier incomes', the effective interest rate to the lender would come down by 5 per cent, and to the borrower by 2 per cent. (As and when general revenues increase, the interest tax could be slowly brought down, with effective interest rates tumbling further.)

As of July 19, 1996, the total of time deposits of scheduled banks exceeded Rs 3,85,000 crore. At 3 per cent, the revenue to the centre, from scheduled banks alone, would exceed Rs 11,550 crore annually. Add the loans from the financial institutions - 1DBI, ICICI, all other similar lending agencies, the LIC/GIC, and now the Mutual Funds - and additional revenue of the order of Rs 20,000 crore could accrue to the centre only from this one source.

There are many other innovative ways of raising revenue; and this essay cannot possibly go into those. Suffice it to reiterate that all talk of inadequacy of resources is part of the process of disinformation, spread by a combination of domestic and external capital. Resources potential is there for anybody to see; one has to brace oneself and get tough on 'rentier income' as opposed to labour income.

#### EXTERNAL AND INTERNAL BALANCE

One other important area - where the Planning Commission must effectively intervene - is in the arena of policy tormulation which would bring about both internal and external balance. Incidentally, additional resources of the type indicated above would automatically help to achieve both. In fact, foreign capital would become available on much better terms only if domestic savings go up sharply. (Also, incidentally, a sharp reduction in the rate of interest would also bring down, over a period, the government of India's interest payment liability, which would also help to bring about a more balanced state of the fisc). But external balance requires a more careful watch on imports, both of inessential consumer goods and of essential intermediates like oil. The latter must be contained through the development of coal resources, through renewed search for oil and more efficient (and vigorous) exploitation of domestic oil and natural gas.

The exploitation of other potential energy sources, through increased biomass production, through the extraction of methane from all waste products, through micro hydel power along all fast running streams of water, are other ways of meeting our increasing requirements of commercial energy and scarce fuels.

Resource Planning in short cannot be left to the forces of market demand and supply, to the 'enlightened self-interest' of individual agents of production. National priorities and needs rather than the maximisation of profits by each individual must inform the general direction of the use of resources, for which individual agents can be allowed to compete subject to certain overall national considerations.

The present scenario - where the annual trade account deficit alone is \$ 7 bn or more. and where the servicing of private external capital costs another \$ 4.5 bn (both figures being actuals for 1995-96) - is just not viable on a long-term basis. We have so far been bailed out by remittances of Indian workers abroad to the tune of \$ 6 bn annually. This is now expected to come down, with the exodus of Indians with expired visas from the UAE. We must bring down our trade gap; we must control the explosion of remittances for servicing external private capital. The Planning Commission must lay down strict priorities, in terms of which policies of the commerce, industry and finance ministries must be reshaped.

#### **CONCLUDING REMARKS**

In brief, the Planning Commission must be restored to the position of laying down the basic framework of economic policies, within the parameters of which different economic ministries of the government must devise their own detailed policies. But this calls for a sea-change in regard to the position of the Planning Commission within government. It calls for a change in the vision of the chairman of the Planning Commission, from that of a 'humble farmer' to a statesman It calls also for a rare insight, both in the Planning Commisson and in the government generally, into the emerging international scenario, into how India's national interests can be subserved. The first decision therein is to selectively engage/disengage with the world economy.

We must take advantage of 'knowledge', which is a worldwide development; but we can only do so if we promote our own research and development and translate knowledge into technology. We are capable of doing so, as past experience in the nuclear and space technologies has demonstrated. Also, we must improve our 'organisational' abilities, "Knowledge", said Altred Marshall, "is our most powerful engine of production ... Organisation aids knowledge...' (Alfred Marshall, Principles of Economics, Eighth edition (1920), Macmillan, 1947, pp 138-39). We are deficient in knowledge, and poor in the matter of organisation. But, we have enormous latent capability in regard to both, and again, nuclear and space technologies are proof, if any were needed.

But, we must disengage with the world economy in two ways. First, we must prevent predatory external capital, particularly shortterm capital, from devastating our economy. This is quite easily achieved, by a high enough capital gains tax; and a lowering of interest rates would also help greatly. (What is more difficult to control is the flight of domestic epaital, through over-invoicing of imports/underinvoicing of exports. But that objective can be achieved through the maintenance of macro-economic stability combined with sustained development of the economy. This essay has been concerned with how to achieve the latter.) Secondly, our disengagement with the rest of the world has to be in the context of imports, we must not allow India to become the dumping ground for obsolete or polluting technology, and for surplus 'clitist' consumer goods which are sold primarily through high pitched advertisement campaigns. A really high rate of duty is the best way to both achieve this end and get some additional revenue from those to whom money is of little concern, as long as they can have their own lifestyle.

All this is possible. Is it likely? If one were to go by the pronouncements of those in power today, such a scenario is unlikely to emerge. Yet, no one can really predict. One never knows when a 'humble farmer' suddenly sheds his provincialism, emerges from his roots and his background, and gets to become a symbol of national regeneration. (Was Gautam, the Buddha, not born in a royal family?)

# BANK that DARED

To capitalise on the promise of a new India. To surpass all expectations. To emerge triumphant. To conquer time. And to achieve the extraordinary.

The Bank was inaugurated on October 30, 1994 by Dr. Manmohan Singh, Honourable Union Minister of Finance.

- ✓ Mobilised Rs. 100 crores on the first day.
- ✓ Opened 10 branches in just 11 months.
- ✓ Achieved Rs. 30 crores profit in 12 months.
- ✓ Crossed Rs. 1000 crores of deposits in just 12 months.

All this and more, because the Bank dared to be different.

# **Sociology and Common Sense**

#### Andre Beteille

Besides the empirical grounding in careful observation and description of facts, sociology as a discipline is characterised by its rigorous search for interconnections among different domains of society and its systematic use of comparisons. These preoccupations make sociology anti-utopian in its claims and anti-fatalistic in its orientation, and distinguish its 'generalised' knowledge from localised commonsensical knowledge.

SOCIOLOGY in contemporary India is a loosely-defined field of intellectual activity. There are pervasive disagreements about its aims, its scope, its approach, its methods, its concepts and its very subject matter. Many would say that it is at best a subject. and not quite - or not yet - a discipline. There are professors of sociology who not only disapprove of the subject as it exists but are doubtful about the very possibility of its existence; and there are laymen with only a passing acquaintance with its vocabulary who speak confidently about its aims, objectives, methods and procedures If I began to give an account of the unsolicited advice I have received about what kinds of sociological studies I should undertake and how I should conduct them from civil servants, bank managers, engineers, social workers, even society ladies, I would hardly have time for anything else. No sensible citizen would dream of offering that kind of advice to a chemist, a geologist or even an economist; sociology seems by contrast to be grist to everybody's mill. Part of the ambiguity and uncertainty characteristic of the subject arises from the fact that it touches the everyday experience of the ordinary person at so many points; and it often appears so close to common sense that there is an inevitable tendency to use the one in place

On this occasion I shall confine myself largely to academic sociology or the discipline that is pursued under that name in the universities and institutes of research. This is not to suggest that the subject can have no place outside of academic institutions. Auguste Comte and Herbert Spencer, two of the most influential sociologists of the 19th century, had little to do with universities, and Max Weber who came after them did much of his work outside the university. At the same time, sociology has been a recognised academic discipline in India for more than 70 years, and there has been a virtual explosion of the subject in universities and research institutes since independence. It may be useful to look at the work being done in these centres of study and research before enquiring into the relationship of the subject to the wider intellectual currents in society.

I wish to argue that for all its own unresolved, and in some cases unresolvable, differences, sociology is distinct from

common sense. It has a body of concepts, methods and data, no matter how loosely held together, for which common sense of even the most acute and well-informed kind cannot be a substitute. For one thing, sociological knowledge aims to be general if not universal, whereas common sense is particular and localised. Educated, middleclass Bengalis, like other educated or uneducated people anywhere, tacitly assume that their common sense is common sense as such or the common sense of mankind An important contribution of sociology has been to show that common sense is in fact highly variable, subject to the constraints of time and place as well as other, more specifically social constraints.

To say that sociology is distinct from common sense is not to suggest that it should seek deliberately to be areane or esoteric. Because it is so difficult to disengage oneself from common sense in the analysis of the human condition, and particularly in the study of one's own society, professional sociologists are frequently tempted to take recourse to needless conceptual and verbal sleight of hand. This is an occupational hazard that must be kept under constant scrutiny. N K Bose used to say that there are two kinds of scientists, those who make complex things simple and those who make simple things complex, and that his preference was for the former. We must surely deplore the mystification of the simple through the display of technical virtuosity. but we must also recognise that common sense is not always successful, by its own unaided effort, in making complex things simple. Let me make one thing clear: when I say that sociology should be pursued as a serious intellectual discipline, I do not mean at all that it should seek to trump common sense by adopting an inflated style. I am only too conscious of the fact that sociological writing tends to be cluttered with the needless use of heavy academic slang.

Thus, sociology has to steer an uneasy course between two equally unfruitful alternatives: submergence in the common sense of the scholar's own environment, and absorption in a narrow and self-satisfied technical virtuesity unconnected with the substance of social enquiry. I would like to emphasise that nothing will be gained by abandoning either common sense or the

cultivation of technical skills. Just as common sense is full of snares and pitfalls for the unwary sociologist, so too technical virtuosity becomes a distraction when pursued as an end in itself. In what follows I shall have little to say about technical virtuosity, my main concern for the present being with the inter-penetration of sociological knowledge and common sense

I

I would like to illustrate the nature of the problem by referring, very bacfly, to my experience as a teacher of sociology af the postgraduate level over the last three decades. The question with which I wish to start is why sociolo, y is such a difficult subject to teach. This may appear as an odd question since, compared to the natural sciences or even economics, sociology is regarded by the majority of students as a soft subject chosen thancipally by those for whom other. more attractive or more difficult options are closed. To be sure, the routine teaching of sociology at both undergraduate and postgraduate levels goes on throughout the country without much apparent exertion from either teachers or students. What I have in mind, on the other hand, is teaching as a serious and unremitting effort to open the mind to new facts and new arguments, and the unsuspected connections among them

Again, I have in mind not only teachers who are prepared to make the effort, but also students among whom a certain interest in the subject may be presumed to exist. The most serious obstacle to the concentration and deepening of the interest is that the better equipped students soon begin to wonder what there is to learn in sociology except a scries of terms and concepts; and, in the society of India, a variety of observations on sillage, caste, joint family, class, community, urbanisation, industrialisation, modernisation, and so on, with which they are already familiar to a greater or lesser extent. Sociology does not have the kind of formal theory that can be readily communicated by the conscientious teacher to an attentive studer!. It does not confine itself to a body of facts delimited by space and time, as do geography and history to a large extent. It deals with both arguments and facts, but the connections among them often appear loose, open and slippery.

In the absence of a clear and established framework, discussion and argument tend to wander in every direction. This may be a good thing in a research seminar, but it makes both teaching and learning extremely difficult in the classroom. In a research seminar, the discussion has to be confined at least within the boundaries of the topic specified. In MA or undergraduate teaching, on the other hand, one can expect a change of gear from one course to another and, even within the same course, from one topic to another. While students might easily comprehend, item by item, what is being taught or explained, it is often very difficult for them to grasp the connections among the items. It sometimes appears that every argument as well as its opposite is true; and facts can be marshalled, without too much trouble, to support contrary theories.

In my experience, students find it hard to cope with a subject in which the teacher is unable to provide that one correct answer to each important question, whether it is about class, or kinship, or religion, or politics. The laws of physics and, up to a point, the facts of history, no matter how complex or detailed, can generally be stated in terms that can be judged as either right or wrong. In sociology, the situation is often different. with greater room for ambiguity and disagreement. Students who can write fluently use their common sense and a superficial acquaintance with names and opinions to cobble together reasonably persuasive answers. Others who may have struggled with the subject but are handicapped by poverty of expression produce answers that are weak, confused and meandering. The examiner is often unsure whether he is giving credit for a wellwritten essay or for a good knowledge of the subject. Exactly the same problem arises in evaluating manuscripts for journal articles or books; many atrivial article gets published because it is written in good prose, where one with a more substantial argument, but badly presented, gets rejected.

Among students, the use of common sense (and fluency in language) is most in evidence in papers dealing with India. After all, every Indian student knows something about caste, class, joint family and Hinduism, and if he has some mental agility, he can write a plausible essay on any of these topics without being too far wrong. But such a student soon finds himself out of his depth when he has to deal with such topics as kinship in Africa, or religion in Indonesia, or social mobility in France. Hence I am ill at ease with the patriotic mal of those scholars who seek to confine the teaching of sociology to materials relating largely to India. No student can learn how to construct a proper sociological argument unless he is taught to handle empirical material relating to every type of

society, his own society as well as other societies.

The most acute pedagogical problem in university departments of sociology in India is to integrate what is taught under sociological theory with what is taught under the sociology of India, So far as I know, there are courses devoted to both major areas in all postgraduate departments of sociology in the country, and so far as I can judge, they are nowhere integrated in even a moderately satisfactory way. I point only to the gravity of the problem without seeking to propose any easy solution to it. The path chosen by most Indian sociologists as they move towards maturity is to steadily jettison the general equipment of sociological knowledge in order to give their undivided attention to the problems of Indian society. I, on the other hand, believe that by turning away from the accumulated concepts, methods and data of sociology in general, we will in the long run only impoverish and not enrich the sociology of India.

In the last 40 years there has been a slow but steady displacement of interest away from the general concepts, methods and theories of sociology towards an enhanced concentration of attention on the current problems of society and politics in India. Again, I would like to draw on my personal experience to make a point. Thirty years ago, when I went to lecture to students of sociology in universities outside Delhi, my hosts were quite happy to hear me speak on general topics: theories of evolution, types of lineage system, relations between status and power. and so on. Now they mostly wish to hear about reservations, caste politics, communalism and secularism.

Virtually the only active intellectual contact professional sociologists have with new developments in theory and method is through their teaching of students at the MA and to some extent the BA (Hons) levels; those who work in specialised institutes of research have largely to do without even that. Research seminars are generally, if not invariably, on topics dealing with India, and there is often a conspicuous absence of a broader comparative or theoretical interest. Then, there are the large annual conferences: these are now devoted almost entirely to current affairs, and the less newsworthy features of even Indian society and culture, and their underlying structures, receive scant attention.

I should now disclose the real reason for my anxiety. It is not only the civil servants, the bank managers and the engineers who present their common sense as sociology. Many professional sociologists do just the same, although they naturally try to give their common sense an air of authority by dressing it up in their own kind of jargon.

Sociology has always and everywhere maintained some concern for current affairs. but that concern does not necessarily drive out other, more academic interests in topics that are remote from the obsessions of newspaper editors and columnists. N K Bose maintained a lifelong interest in the distribution of material traits; G S Ghurye wrote on dual organisation, on 'gotra' and 'charana', on Indian costumes and on ancient cities; Irawati Karve wrote a book on kinship organisation in India. Such topics have a marginal place in the many regional and national seminars and conferences organised by sociologists today; they have largely been driven out by what are believed to be more socially relevant subjects.

There is no doubt that the preoccupation among Indian sociologists, regularly expressed at seminars and conferences, is with the appropriateness of the existing body of sociological knowledge to the understanding of Indian society and culture. These discussions are not so much about methods and techniques of investigation as about the presuppositions of sociological knowledge and about the nature of understanding and explanation. They tend to be presented in highly abstract and speculative terms, and rarely lead to any concrete or workable propositions. Alternative approaches to the study of Indian society can hardly produce results unless they are linked to the disciplined practice of a craft; no new approach has emerged in science and scholarship from the mere desire to have a new approach.

II

Today, at the close of the 20th century, it is impossible to practice sociology as a serious academic discipline without drawing on the vast reservoir of sociological concepts, methods and theories created by scholars over the last hundred years. This has been mainly, though not solely, the work of western scholars, and like any accumulated body of knowledge, it contains much that is mistaken, distorted and obsolete. Therefore, in the pursuit of his work, the practising sociologist, whether in the west or in India, has to maintain an alert and critical attitude to it. But that is far from saying that he can set it all aside in the hope that a completely new framework can be created ex nihilo by some as yet unrecognised genius nourished by the Indian air. Surely, there is room for an Indian perspective, or, better, several Indian perspectives, but to be viable, they have to address themselves to society and culture everywhere, and not just to Indian society and culture.

The builders of modern sociology, Emile Durkheim, Max Weber and others, took the whole of human society in its diverse and changing forms as their subject of study, even when their primary attention was devoted to their own society. To be sure, their observations on other societies were limited, one-sided and often misleading. But they believed, one and all, that the disciplined application of the sociological method would contribute much to the understanding of their own society; and that this understanding could be deepened and broadened by systematic comparisons between their societies and other societies. They were all convinced that common sense was not enough to reach the understanding they sought, and that they had to fashion new tools of enquiry and analysis to attain their objective.

The sociologist who did most to lay bare the illusion of understanding created by common sense was Emile Durkheim. He argued tirelessly that the systematic investigation of a subject was not possible unless the investigator freed himself from his preconceptions of it. These preconceptions, shaped by a limited experience, are what generally pass for common sense in a given society; they are not only often wrong, but act as impediments to the examination of the available and relevant facts.

Early in his career Durkheim gave a brilliant demonstration of the superiority of his approach over that of common sense through his study of suicide. His argument was that suicide was a social fact whose torms and patterns could not be explained by the known facts of human psychology Now that we have behind us Durkheim's study and the many others to which it gave rise. this perhans does not seem a great revelation any longer. But when it first appeared, it did seem startling to discover that social causes were behind what common sense might lead one to believe to be the supremely private or individual act. As is well known, Durkheim pursued systematically the distinction between the incidence and the rate of suicide. and brought together a wealth of data to show that suicide rates varied systematically between societies, and between religious, occupational and other groups within the same society. Further, while suicide rates were on the whole highly stable, they were also subject to fluctuations due to the operation of social and economic causes which he was able to identify. One of his remarkable findings was that suicide rates go up significantly not only after an economic crash but also after an economic boom

Not all of Durkheim's observations on suicide have stood the test of time, but that is not the point. The point is that when he had an important insight that appeared to go against common sense, he decided, as a sociologist, to test that insight by systematically assembling a large body of data, and applying to the data, concepts and methods that may also be applied to other domains of life in other parts of the world.

One of Mex Weber's most fundamental ideas by which sociology has been enriched everywhere is that the consequences of human action are rarely the same as the intentions of the actors, and that sometimes the two are diametrically opposite. One can say again that it is no great discovery that our actions often miscarry and end in ways that we least expected. But in science and scholarship what counts is not just the original insight, but the significance of the domain to which it is applied, and the methods and data by which the insight is tested. Weber's application of the insight in exploring the relationship between religious values and economic action has produced a rich harvest of detailed and systematic studies by generations of sociologists the world over.

Here I would like to make a brief observation on Weber's approach to religion, partly because of its intrinsic importance and partly because it has been frequently misrepresented. The prevailing view among social theorists until Weber's time was that. for good or evil, religion had served as a source of social stability. This was Marx's view, and because he believed change to be both necessary and desirable, he assigned a negative value to religion. Durkheim, on the other hand, assigned a positive value to the same phenomenon since he believed that stability was essential for social well-being. Weber's originality lay in his investigating, systematically and with a sharp eye for detail, the profound changes brought about in economic life by the breakthrough in religion. In his view, it was neither the commitment to ideal values nor the demands of material existence, but the tension between the two that was the true source of change in society.

#### Ш

What I have tried to stress so far is that sociology is a disciplined and specialised activity in which the role of originality should not be exaggerated. It is a craft that needs patience and care, and a long apprenticeship to acquire. Its concepts and methods are not things that any intelligent person can construct on his own in order to satisfy a passing intellectual urge. Having drawn attention to the empirical grounding of the discipline in the careful observation and description of facts, I would now like to make a lew remarks on two of the fundamental preoccupations of sociology. its rigorous search for interconnections among the different domains of society, and its systematic use of comparisons.

Sociology is not about economic life, or political life, or religious life, or domestic life; it is not about class, or about caste, or about community; it is not about the ideal of equality or the practice of inequality. It is about the interconnections among all these and other aspects of social life. This

constitutes what some have been pleased to call the 'functionalist bias' of sociology. While freely admitting to that bias in my own work, I must point out that it does not in any way rest on the presupposition that the interrelations in society are harmonious rather than inharmonious, or stable rather than unstable. It is for this reason that I speak simply of the 'search for interconnections' and not of a 'holistic approach'; for the latter incorporates ideas about a total social structure with which I am out of sympathy. Sociology in the last few decades has been invaded by a kind of mindless Marxism for whose adherents the word 'functionalist' has acted like a red rag to the bull. On the other hand, it is through a long chain of sociological arguments that the very fruitful distinction has emerged between 'social integration' and 'system integration'.4

The search for interconnections is laborious and time-consuming, and it has its own procedures, survey research, statistical analysis, participant-observation and case studies. It does not always or even generally lead to spectacular results, but meaningful and unsuspected connections can be reached only by sifting through masses of connections that are trivial and easily accessible to common sense. It is in this way that the great advances in sociological knowledge have been made, generally incrementally and only occasionally by a dramatic breakthrough.

The careful and detailed examination of interrelations has shown that sometimes economic factors were important where they were not suspected to be, and at other times the ties of kinship and marriage were seen to have unforeseen consequences for various areas of social life. However, the belief that one single factor or set of factors, whether economic or religious, holds the key to all the interconnections in society has been a hindrance rather than a help in sociological enquiry. Sociology has never been at peace with either the religious interpretation of the world or the materialist interpretation of history

Patient and systematic studies by sociologists have brought to light many aspects of Indian society where things are not what they seem. I can refer here to only a few examples, and that too very briefly. Shortly—tter independence a whole range of village monographs began to be published by trained anthropologists, and these have altered our perception of rural India and Indian society in general. M. N. Srinivas formulated the important distinction between the 'book-view' and the 'field-view' of Indian society,' emerging—the leading proponent of the latter, and ic,—atedly drawing attention to the errors of the former.

Srinivas's most seminal contribution was his exposure of the misrepresentation of caste among educate ! Indians. He attacked

inflexible system based on the division of Hindu society into the four 'varnas'. He maintained, "The varna-model has produced a wrong and distorted image of caste". He was able to show that far from being absolutely rigid and inflexible, the caste system accommodated distinct forms of social mobility. Further, by drawing attention away from varna to 'jati', he was able to see more clearly than the political commentators of the day that the role of caste was increasing rather than declining in Indian politics.

My own detailed study conducted in Tanjore district more than 30 years ago addressed itself to the view then widely prevalent that the Indian village was a 'little republic.' I had little difficulty in showing that the village in which I lived and worked for nearly a year was riddled with inequality and conflict; and my reading of village monographs by other social anthropologists, both Indian and foreign, and my general training as a sociologist convinced me that what I had observed and recorded was general rather than exceptional.

Similarly, the work of my colleague, A M Shah has exposed, through the systematic analysis of a wealth of empirical material, some common misperceptions about changes in the Indian family system." These misperceptions arise partly from a confused conception of the joint family, and partly from insufficient attention to the available evidence. Shah's work shows that the proportion of 'joint-family households' never greatly exceeded that of 'nuclear-family households'; that in most sectors of contemporary Indian society, urban as well as rural, there are still many joint-family households; and that the average size of the household in the Indian population has remained roughly the same in the last hundred years.

Despite the rich harvest of studies on practically every aspect of Indian society and culture, there is a striking shortage of studies by Indian sociologists of other societies and cultures. Not only that: in their empirical research, most Indian sociologists tend to confine their attention to their regions of origin: Bengalisto West Bengal, Gujaratis to Gujarat, and Tamilians to Tamil Nadu. It is unfortunate that Indian sociologists have taken so little advantage of the comparative method, because it is in the use of that method mainly that sociology scores over common sense.

Since I attach a great deal of importance to the comparative method to the discussion of which I have devoted time and effort, I cannot pass it by without a few brief observations. It is useful to begin with what Durkheim said on the subject. "Comparative sociology", he observed, "is not a special branch of sociology; it is sociology itself". 10

THE SOCIOIOGIST ACQUITES THE HAUIT OF comparison so that no matter which activity or institution he is examining, he brings to it insights from the study of similar activities and institutions in other societies and cultures. Nor is it merely a matter of habit; rules of procedure have been devised, tested and refined as an essential part of comparative study. There is nothing in the comparative method as such that requires every investigator to cover the entire range of societies, near and distant. As Durkheim put it, comparisons "can include facts borrowed either from a single and unique society, from several societies of the same species, or from several distinct social species".11

India, with its large and varied population, offers rich possibilities for comparisons within its own confines. I will conclude this section by referring to two examples of comparisons from my own work, one very restricted and the other very wide in scope. The first was a taluk by taluk comparison in Tanjore district of the relations between the cleavages arising from the ownership, control and use of land, and those arising from caste;12 it deepened my own understanding of the peculiar combination of factors that leads to class formation in agriculture. The second is a long-standing comparative study of positive discrimination in India and affirmative action in the US: it has enriched my understanding of the distinction between rights and policies, and of the relationship between distributive justice and institutional well-being.13

Common sense is not only localised, being bound by time, place, class, community, gender, and so on; it is also unreflective since it does not question its own origins and presuppositions, or at least does not do so deliberately and methodically. As an intellectual discipline, sociology cannot be a creature of common sense; but that does not mean that it should turn its back on it. Our sociology is influenced to a greater or lesser extent by the common sense which is a part of our social environment: to what extent is that common sense in its turn influenced by sociology? Sociology will count for little as an intellectual discipline if its insulation from common sense means that it merely reproduces itself, and sociologists write only for each other. Its success will be judged in the long run by its ability to act back upon comon sense and contribute something to its renewal and enrichment.

Common sense is based on a limited range of experience of particular persons in particular places and times. Where it relates to such matters as family, marriage, kinship, work and worship, people are inclined to believe that their way of doing things is the right way or the reasonable way. Other ways of acting in these regards strike them as being not just wrong, but contrary to common

sense. This is occause they observe or experience other ways of acting and thinking only in bits and pieces, and not in their entire context. Seeing alien and unfamiliar practices in their proper context often makes those practices appear quite sensible; familiarity with a wide range of practices occasionally makes one's own ingrained ways of acting and thinking appear peculiar if not quixotic. An old Chinese poem says:

When I carefully consider the curious habits of dogs,

I am compelled to conclude that man is the superior animal

When I consider the curious habits of man, I confess, my friend, I am puzzled.

Comparative sociology is a great help in acquiring and maintaining a sense of proportion.

I would like to avoid inviting the charge of making invidious distinctions between disciplines. At the same time, it is essential to draw attention to the peculiar preoccupation of sociology with the similarities as well as the differences among societies, with comparison as well as contrast. To be sure, historians have recorded diverse beliefs and practices among people at different places and different times over a longer stretch of time than have sociologists. But their characteristic tendency has been to study the diversity of beliefs, practices and institutions severally rather than jointly. It is the rare historian who does comparative history, whereas one cannot really escape from comparison and contrast while doing sociology.

Sociology not only deals with facts from the entire range of human societies, it seeks to place those facts on the same plane of observation and analysis. The educated layman can hardly be expected to master all the facts with which the sociologist deals. He follows at best the method of apt illustration, and no consistent rule of procedure for the selection and arrangement of facts. On the other hand, sociological practice develops a characteristic style of argument that does tend to filter through to wider and wider circles in the course of time. Over the long run, the sociological mode of reasoning has had some effect on thinking about education, about politics, about class and about inequality.

Where sociological reasoning acts upon common sense, it tends to moderate both the utopian and the fatalistic elements in it. Common sense easily constructs imaginary social arrangements in which there is no inequality, no oppression, no strife and no constraint on individual choice: a world in which society makes it possible "for me to do one thing today and another tomorrow, to hunt in the morning, fish in the afternoon, rear cattle in the evening, criticise after dinner, just as I have a mind, without ever becoming hunter, fisherman, shepherd or critic". 14

Sociology is anti-utopian in its central preoccupation with the disjunction between ideal and reality, between what human beings consider right, proper and desirable, and their actual conditions of existence, not in this or that particular society, but in human societies as such.

Sociology is also anti-fatalistic in its orientation. It does not accept the particular constraints taken for granted by common sense as eternal or immutable. It provides a clearer awareness than common sense of the range of alternative arrangements that have been or may be devised for the attainment of broadly the same ends. No social arrangement, however attractive in appearance, is without some cost. Social costs and benefits are far more difficult to weigh and measure than the purely economic ones. A finelytuned judgment is essential for this, and that can be formed only through the disciplined and methodical examination of the varieties of actual social arrangements created, adopted and replaced by successive generations.

This leads to the question of valueneutrality or, better, the distinction between value-judgments and judgments of reality in sociology as against common sense. There is now a considerable body of literature, some of it abstract and technical, on this question, although this is not to say that all disagreements on it have been or can be settled among sociologists. By and large, there is agreement among them that questions of fact are distinct from judgments of value, and the two ought to be differentiated as clearly as possible by all the technical means available.15 The disagreement is about the extent to which the distinction can be consistently maintained in practice, and the best means to be adopted in achieving or approaching that end.

There is an influential tradition in sociological enquiry that views the methods and procedures of the discipline as being, at least in principle, the same as those of the natural sciences. Not only animals, vegetables and minerals, but also men and women and their social arrangements can be made subjects of science.16 In this tradition, which has generated much useful information and some fruitful analysis, all descriptions and all evaluations are suspect unless they are made in accordance with technical procedures that systematically exclude or at least minimise the investigator's bias; and common sense, in this view, is always a source of potential bias and error.

Not all sociologists view their discipline as a kind of natural science; today perhaps the majority of them view it as a moral science rather than a natural science. One of the problems is keeping values strictly separate from facts in the moral or human sciences is that values themselves are an important part, some would say the most

important part, of their subject matter. In other words, the sociologist has to treat values as facts, as a part of his data, whether he is studying his own society or some other society, or both. But even here, he has to distinguish as clearly as possible the different kinds of facts with which he deals, for instance, the demographic composition of a community as against the religious ideas of its members.

It takes a special kind of discipline - at once intellectual and moral - to insulate the values being investigated by the sociologist from his own personal and social values. In a sense, what the sociologist investigates and the means by which he investigates it are of one piece, more so where the study of one's own society is concerned. This makes the separation between the two particularly urgent on the intellectual plane and particularly difficult on the moral plane. As Max Weber had observed on this question: "Nor need I discuss further whether the distinction between empirical statements of fact and value-judgments is 'difficult' to make. It is."17 It is here, and particularly in India, that the sociologist is most frequently tempted to let go of his slippery hold over the resources of his discipline and to revert to plain common sense.

There is now an accumulated body of experience as well as reasoned discussion relating to the choices involved in the study of one's own society as well as the study of other cultures. The experience shows the significance in all cases of the standpoint of the investigator in the human sciences, there is no Archimedean point from which the investigator can examine his subject matter as a completely disengaged observer. The same subject reveals different aspects when investigated from different standpoints; but although different, the results of these investigations need not be contradictory. Indeed, the advance of sociological knowledge becomes possible only when investigations made from different standpoints make themselves available to each other for mutual correction. This is a slow, laborious process that does not, by its very nature, have any final outcome.

In conclusion, it is not true that the sociologist does not or should not express moral preferences. But his moral preferences are or ought to be formed on a somewhat different basis from what is given to each person by his common sense. It may not be possible — or even desirable — for sociology to acquire the intellectual authority to govern the moral choices of the individual members of society. Those choices are in the end matters of individual judgment and individual responsibility. Sociology can only help a little by giving the individual a better sense of the alternatives available, and of the likely costs and benefits of the available alternatives.

#### Notes

[This is the text of the N K Bose Memorial Lecture delivered in Calcutta on June 20, 1996 under the auspices of the Anthropological Survey of India on the occasion of its golden jubilee I am grateful to the Director of the survey, R K Bhattacharya for inviting me to deliver the lecture. I would also like to thank M N Srinivas for his comments on a draft of the lecture.]

#### Indian Institute of Management Bangalore

# Invites applications for admission to the FELLOW PROGRAMME IN MANAGEMENT (equivalent to Ph.D.) starting July 1997

The Fellow Programme is a full time residential doctoral - level programme designed to equip students for careers in teaching, training and research in functional and sectoral areas of management. The Fellow Programme students can select their specialisation from the following areas and sectors :

| AREAS 🔾                                                | Corporate | Strategy   | and Po    | licy 🗀 Eco | onomics  | and Soc   | ial Sciences  |
|--------------------------------------------------------|-----------|------------|-----------|------------|----------|-----------|---------------|
| Marketin                                               | g 🗀 Organ | nisation E | Behaviour | , Personne | el Manag | gement a  | nd Industrial |
| Relations                                              | Finance   | & Con      | trol 🔾 F  | Production | & Ope    | rations N | Management    |
| Quantitative Methods, Information Systems & Computers. |           |            |           |            |          |           |               |

SECTORS \(\) Agriculture and Rural Development \(\) Education \(\) Energy and Power \(\) Health and Population \(\) Human Settlement and Environment Studies \(\) International Management \(\) Transportation.

**ELIGIBILITY** \* A Master's Degree with a minimum of 55 per cent marks (or equivalent recognised qualification). Candidates appearing for final degree exams can also apply, provided they complete the examinations and all other requirements for the degree on or before June 30, 1997.

#### OR

\* First Class Bachelor's Degree in Engineering/Technology or a Second Class Bachelor's Degree in Medicine with a minimum of 2 years experience.

In addition, FPM applicants must also satisfy the eligibility requirements of the Post-Graduate Programme of IIMB (For details see CAT advertisement appearing separately). \* PGPs from IIMs with minimum CGPA 4.5/6 or equivalent are exempt from CAT and first year course work.

**FINANCIAL SUPPORT** \* Stipend of Rs. 1800/- or Rs. 2400/- P.M. depending on qualifications and experience to cover average monthly living expenses (including fee, room & board) of about Rs. 1400/-. An annual contingency allowance of Rs. 5000/- will also be provided.

⇒ HOW TO APPLY: Step 1. Take Common Admission Test (CAT) on 8th December 1996. Step 2. Obtain admission forms free of cost from FPM Office, Indian Institute of Management Bangalore, Bannerghatta Road, Bangalore - 560 076 and apply.

Requests for forms must be accompanied by a self-addressed envelope (size 9"x12") affixed with stamps worth Rs. 11/- and a self-addressed slip.

⇒LAST DATES: 1) To receive requests for application forms: 31st October 1996.

2) To receive completed application forms : 29 th November 1996.

### **Agricultural Modernisation and Education**

#### **Contours of a Point of Departure**

#### Krishna Kumar

The English-speaking ruling elites of the 1960s were keen to propagate the US-inspired strategy of agricultural modernisation based on modern technologies. This was reflected in the Kothari Commission report on education, which sidelined the concept of basic education in favour of general elementary education for rural children intended to inculcate a scientific outlook.

THE year 1966 was an unusually important year in the history of independent India. As time goes by, it appears that 1966 might qualify to be seen as a turning point in postindependence history, or at least as a year when certain existing tendencies consolidated to bring about a virtual end of the earlier era and its contradictions. The broader contours of this year are familiar enough, but it may be useful to recall them briefly for the sake of easy reference later. The year started with the death of the prime minister Lal Bahadur Shastri, less than two years after he had succeeded Jawaharlal Nehru. His death came as a sudden end to the dramatic event of a war with Pakistan - a war which influenced not only India's economic and social priorities for a long time to come but also her placement in the political geography of her neighbourhood. Only three years earlier India had to fight a war with China. Though the outcome of the 1965 war was rather different from the one fought in 1962, both wars contributed to the self-perception of India as a country surrounded by hostile neighbours. The war with Pakistan was fought at a time marked by the shortage of staple food, mainly on account of the failure of the monsoon which was to be repeated in 1966. The perception of food scarcity being just as crucial a battle to be won as the war with Pakistan was reflected in the slogan that Shastri gave to the nation in his brief tenure as prime minister: 'jai jawan, jai kisan'.

This slogan served to give Shastri a sort of halo in the popular mind which he otherwise would not have had, given the brevity of his tenure and his unassuming personality. In both these aspects he presented a contrast to Jawaharlal Nehru. Shastri's image, or rather its contrast with Nehru's image, seems to have played a major role in shaping the internal politics of the ruling Congress Party and even the general political landscape of India in the post-Nehru interregnum, which concluded with the choice of Indira Gandhi as prime minister after Shastri's sudden death in early 1966. It has been said that Shastri's period represents a weakening of decision-making mechanisms in the Congress Party.' If it is true, at least a part of the explanation lies in the 'de-centring' that Nehru's demise implied, given his charismatic personality and his record as a fighter for independence. particularly in association with Gandhi. But 'weakening' is a word one sees repeated in Shastri's period and then, after him, in the context of social fabric and the economy. One sphere in which the social fabric was frequently reported to be showing signs of weakness throughout 1966 was that of youthadult relationships. An upsurge of student agitations seems to have taken the adult society by surprise.2 Crisis of values, decline of character, weakening of social control. and influence of politics were the conceptual tools with the help of which commentators of the period tried to explain why youth had become so restive and indisciplined. And if politics was among the factors affecting the young, it did not seem to be doing too well in its own world of organising state policy. The biggest challenges in political life had to do with ongoing resistance to land reforms and economic pressures from the World Bank and the United States on an already deeply indebted economy.3

Large landowners constituted a major component of the social forces which had been working for some time to undermine the weak but significant moves made in the 1950s towards making the distribution of land less iniquitous. These moves had two main objectives: social transformation and improvement of agricultural productivity. While more than 70 per cent of the population depended on land, one-third of this population was landless and nearly half the people who owned land had less than an acre. Abolition of the zamindari system and the imposition of land ceiling were the major steps which had been taken under Nehru to ameliorate this situation. The real value of these steps was greatly reduced by the time taken to put them into effect and the legal loopholes left in them which enabled the target groups to circumvent them.4 These groups had also succeeded in cornering the major share of the benefits provided by the state under the Community Development Programme and the schemes launched later to mobilise co-operative action and public credit for the poor. Yet, despite their success in manipulating the state's attempts to equalise material opportunities, the rich landowners, their political representatives, and many articulate groups in the urban intelligentsia persisted in their perception of the government's approach carrying signs of a 'communist' approach which needed to be resisted.

In order to appreciate the authenticity of such an apprehension it is necessary to step a little deeper into the atmosphere of ideas prevailing in India in the mid-1960s. The cold war had spread far enough to form social territories of intellectual influence wielded by the two super-powers, the US and the USSR. The former had a distinct edge as far as the Indian intellectual territory was concerned. Free enterprise and freedom of expression ('cultural freedom') were used as signposts of protection against the onslaught of communism. The contrary construction was struggle against American imperialism. With its small but influential English-educated elite. India was attractively placed to receive American influence in different spheres of its civic life, particularly in the spheres of higher education, administration and the media. Direct political influence was of course a matter of constant effort, and for this economic pressure, especially in the context of food scarcity and indebtedness, was a readily available instrument. In the background of India's external policy choices, the application of economic pressure, directly by America or through the World Bank, took increasingly crude forms even as America's feeling of its loneliness in its aggression against Vietnam grew. But cultural and intellectual means of building a domestic hegemony in favour of America's long-term interests was just as crucial as the relentless application of pressure on the food front and India's agricultural policy. The general presence of American names, topics and textbooks subsidised to attract the Indian student and teacher - in the syllabi of Indian universities was supplemented by provision of scholarships for research and professional work in America. The dominance enjoyed by American media, especially its news agencies, and the popularity of magazines like Time, Life, and Reader's Digest, provided yet another layer of support to the construction of an ethos favouring American involvement in India's civic life. No Soviet media agency could perform this function, given the nature of the Soviet press and the conditions of its operation in the home country. Subsidised popular magazines and children's books did slightly better, but the Soviet presence remained marginal to the public space occupied by the Englisheducated Indian intelligentsia. The same could be said of Soviet textbooks and student exchange programmes.

Besides the creation of an intellectual ethos, specific efforts were made to facilitate the penetration of India's fledgling industrial economy, especially the upcoming sector of industries involved in agriculture. Devaluation of the Indian currency and concessions for foreign fertiliser companies were the two major targets of American pressure. These were manifest pressures; far less visible were sustained research and promotion efforts to find the means of supplying technical solutions to food scarcity involving the use of American agrobusiness products. These attempts had begun in the 1950s, but up until the early 1960s ideas of technical improvement in agriculture had to compete with socio-political solutions involving redistribution of land and erosion of traditional structures of dominance. Wars with China and Pakistan, two consecutive failures of the monsoon, and Nehru's death were among the factors which could be said to have accelerated the pressures favouring technical solutions, but external conditions and forces undoubtedly played an important role too. The sequential structure of this drama in India was not very different from what had happened in Mexico earlier.5 What precipitated the pressure on India - her government, especially its food minister in the mid-1960s to fully embrace technical remedies was a dramatic development in the US. The publication of Rachel Carson's Silent Spring in 1962 had given rise to an unprecedented public debate on the degradation of the environment due to the use of chemicals in agriculture. The adverse publicity and legislative action generated by the debate made American fertiliser and pesticide companies intensify their search for foreign markets. The US department of agriculture - a "wholly owned subsidiary of the pesticide industry", according to Ehrlich (1978) - and the World Bank were directly leading this search.

India offered a highly suitable environment for the combined growth of American agrobusiness, including its interests in fertilisers, pesticides, and hybrid seeds. Here was a country with a growing population, prone to malaria, apprehensive of famines, and socially led by a westward looking class of post-colonial clites. And it had a huge body of professionally trained manpower in

the sciences and the social sciences which had been socialised to view desirable change and improvement in India in terms taught by western, especially American, experts. Above all else, India had a vast farming sector waiting to be penetrated by the countless meanings of the word 'modernisation'. Agricultural universities, set up after the model of American landgrant colleges, had initiated the process of shaping Indian expertise under American guidance. Although these universities were not in a position to provide the kind of opportunities of close interaction between industrialists, engineers and farmers as the land-grant colleges in America had been opened to provide [Noble 1977], they had nevertheless begun to perform the simpler role of propagating the virtue and means of profit-seeking among the bigger farmers. The inevitable image of the capitalist farmer as a model lay embedded in the new knowledge and attitudes that agricultural universities and research organisations in India were to provide with American help, both in terms of training of experts and financial help.

#### **EDUCATION COMMISSION**

The mid-1960s, and particularly the year 1966, are also important in the history of post-independence education in India. The Education Commission (EC), popularly known as Kothari Commission after the name of its scientist chairman D S Kothari, was appointed in July 1964, and it submitted its report two years later in June 1966. No other report has received as much attention in the context of education as the Education Commission Report (ECR) has over these 30 years since its submission. Its voluminous size - it runs into some 1,000 printed pages - justified by its all-encompasing frame of reference, and its association with J P Naik who served as its member-secretary, give it a unique place on the shelves of institutional and office libraries concerned with the planning and study of education. It constitutes a 'whole' perspective on education, in the sense that just about every stage and aspect of education is discussed by it, unlike the two major commission reports preceding it and the two others written afterwards. But what gives ECR its distinctive place in social history is its articulation of the agenda of modernisation. If one were to summarise its thousand pages in one word, the word would surely be 'modernisation'. The title of the report, in fact, reveals this single most important theme by linking 'education and national development'. Modernisation meant nation-building through development, and education was the prime instrument for this project in the discourse of the 1960s which the ECR signifies. Myrdal, an admirer of the ECR, summarised it by saying that it envisaged a change in the attitudes and values of 'the whole people' under a socio-cultural revolution oriented towards modernisation (1970).

The opening chapter of the ECR provides us with a hierarchy of national problems to which 'national development' must provide a remedy. Agricultural modernisation is the remedy for the first of these four key problems: self-sufficiency in food: economic growth and full employment; social and national integration; and political development. That this ordering is no coincidence or an editorial choice alone is clarified in the first sentence of the discussion: "The first and the most important of these (problems) is food". This is followed by a quotation from Gandhi: "If God were to appear to India, he will have to take the form of a loaf of bread." The paragraph then goes on to establish the importance of selfsufficiency by referring to the rate of increase in population. Using a 20-year perspective, the ECR says that even if the birth-rate is reduced by half, about 46 per cent of the 1966 population will be added by 1986. "On the basis of present trends", the report says, "in another 10-15 years, no country is likely to have a surplus of food to export". Precisely what trends the EC had in mind is not clear, but the rhetorical value of this statement is indicated in the next sentence which says: "Even if such surpluses existed, we would have no resources to import the huge quantities of food required, or even to import the fertilisers needed". The basis of giving top priority to food self-sufficiency thus stood verified: it is not "merely a desirable but a condition for survival" (p 4).

The theme of self-sufficiency in food finds recurring mention throughout the first chapter. It is emphasised time and again that self-sufficiency in food can only be achieved by applying the principles of science to agriculture. The concept of science is seen as being synonymous with that of modernisation. Science-based technology is said to define the difference between traditional and modern societies. "In a traditional society production is based largely on empirical processes, experience, and trial and error, rather than on science; in a modern society, it is basically rooted in science" (p 12). 'Science' is treated here as an institution rather than as an approach to knowledge, or else it would be difficult to see why the empiricism of the so-called traditional societies, based on trial and error behaviour and experience, does not qualify to be called science. In the structure of meaning that the ECR builds for its argument, science is apparently a symbol, or rather a synecdoche in which a symbol stands for something much bigger of which it is a part. It is meant to remind us of a complex set of values

These values include a secular outlook, freedom from traditional ways of thinking, and faith in change. The last item is recorded with reference to the irreversability of the steps taken towards the goal of modernisation. The text says: "If one tinkers with the problems involved or tries to march with faltering steps, if one's commitments and convictions are half-hearted and faith is lacking, the new situation (ie, the situation representing the outcome of our efforts to modernise) may turn out to be worse than the old one" (p 32) (emphasis added). One can hardly miss the threat embedded in these words and its use to counter all doubts and debates that might be raised in the context of modernisation. Thirty years later today we can notice how the discourse of scientific temper and modernisation was so dependent on the tenacity of faith in them. It is also clear that it was unable to accommodate the critics of modernisation despite according a place of honour to Mahatma Gandhi's words in the outset of the discussion on national development.

The details of the EC's strategy for applying education towards achieving the goal of agricultural modernisation appear in Chapter XIV which is titled 'Education for Agriculture'. Two major recommendations made in this chapter stand out. One concerns the promotion of specialised higher education in agriculture as a science by the establishment of an agriculture university in each state and a related ancillary institutional structure. The other major recommendation is to reject the Basic Education (BE) approach in favour of a general, academic elementary education programme. It is easy to grasp the rationale for the first, for it is consistent with the EC's overall perspective on modernisation of agriculture The ECR takes pains to elaborate on the requirements of modernisation in agriculture to the extent of projecting manpower requirements for trained 'agriculturalists', ie, graduate farmers, in the coming years. In this context, the ECR comes closer than in any other chapter to mentioning the ground reality or the socioeconomic conditions in which educational development was to take place. As Malcom Adiseshiah pointed out in his foreword to Naik's Education Commission and After (1982), the EC avoided the danger of falling between normative and positive positions by deliberately choosing the normative path. It is interesting to note that while projecting the manpower needs for agricultural modernisation the EC saw fit to take the positive route by noticing the prevalence of a highly iniquitous distribution of land in Indian society. It is another, and of course a highly significant, matter that the distribution does not disturb the EC. It recognises that "at present there are nearly

......vii tarriis vi 12 acites vi ilivite (vui vi 50 million farms)" (p 669). This mild and brief acknowledgement is made in order to explain the projected figure of farmers who might become graduates in the next two decades: "If we assume that ownership will change at 3 per cent a year, this means nearly 2,00,000 new farmers inheriting such farms every year. It seems reasonable to think that by 1986, 1 in 50 of these may be an agriculture graduate" (p 669). This statement should suffice to reveal what role the EC envisaged for education in the context of the severely inequal access to land in rural society. The role was to enable the bigger landowners to enhance their material opportunities.

This was the vision embedded in the new strategy of agricultural modernisation which was named a little later as the green revolution. That the ECR should be so happily reconciled to the green revolution strategy of rich landowners being given priority attention in order to enable them to act as pace-setters is hardly surprising. Members of the EC's agriculture education subcommittee included the representatives of just about every section of the establishment of agricultural research. The agriculture universities at Pant Nagar and Bangalore, the Indian Agriculture Research Institute, the Indian Council of Agriculture Research, and the Fertiliser Association of India were among the organisations represented in the sub-committee. The Rockefeller Foundation, which had been active in supporting agricultural modernisation research in Latin America and Asia, was also represented in the EC's sub-committee. Although the Indian agriculture research apparatus as a whole had developed under American guidance, the Rockefeller Foundation's presence in India at the time needs to be appreciated for its own sake. In collaboration with the Indian Council for Agricultural Research, the Rockefeller Foundation had been promoting research for the production of high-yielding varieties of staple crops in India, particularly wheat. By the time the EC was established, the foundation had reported exciting breakthroughs in similar programmes in Mexico and the Philippines The central theme of these success stories was the new wheat plant's ability to guzzle chemical fertilisers along with water without falling over. Only very resolutely neutral students of post-war economic history can doubt that the edifice of the new knowledge and research in agriculture was constructed at least partly to boost the interests of American fertiliser industry, and not just to protect the earth's poor from hunger. The final thing worth noticing in the composition of the EC's sub-committee on agriculture education was the complete absence of anyone representing Gandhian rural institutions. A liberal approach to education would surely have taken the existence of these institutions into account, especially when the group was going to deliberate on the fate of basic education as a model for elementary-level schooling. We can legitimately suspect that Gandhians were kept out of the sub-committee in order to avoid any dilution that might occur due to their presence in the course charted for rural education in general and agriculture education in particular.

#### BASIC EDUCATION

The EC's stand against basic education is recorded in the subsection entitled 'Agricultural Education in Schools (Classes I to X)'. This subsection starts by taking note of the prevailing position of agriculturerelated instruction in primary schools as a craft in Uttar Pradesh, Gujarat and Maharashtra. These three states are singled out as instances on the ground that in the remaining states the number of schools offering agriculture education as a 'craft' an essential part of the diction of basic education - is less than the proportion in Maharashtra. By choosing Maharashtra as the lower cut-off point for portraying the limited achievement of basic education, measured in terms of the introduction of agriculture as a craft, the EC is able to ignore all other states. Apparently, the EC chose this editorial device in order to make basic education look a minor development. Also, in the vocabulary associated with basic education, all rural crafts were perceived as being related to agriculture and rural life. The primary craft around which a great deal of the basic school curriculum was structured was weaving, which included spinning. By denying the relationship between weaving and agriculture, the EC achieved two sementic purposes, one, minimising the spread of basic education in the context of agriculture-related education; two, promoting the new, modern concept of agriculture as a craft unrelated to the diverse traditional crafts associated with village life.

Having demonstrated that the input made by basic education into direct training of children in agriculture as a craft was so limited, the subsection under discussion goes on to make its negative recommendation. The words used for this purpose are so remarkably indirect and carefully chosen that they deserve to be quoted in full. The quotation is also valuable for it records the thought processes involved in the withdrawal of official support for what was the only major attempt made in our country to move education away from its colonial legacy:

As has been made clear at several places in the chapter, massive application of scientific knowledge and skills is basic to the

modernisation of our agriculture. We recommend, therefore, that the period which can be spent in schools should be utilised in imparting a sound general education, with particular emphasis on mathematics and the sciences. This, we feel, would be the best preparation for coping with the rapid changes that are bound to characterise our agriculture in future. It is because of these and other considerations that we have been unable to endorse the organisation of formal courses in the schools for educating the primary producer (p 659).

Why did the EC choose such heavily cloaked words? Indeed, 'being unable to endorse' is indirect enough, but "the organisation of formal courses in the schools for educating the primary producer" takes the cake for opacity in the history of official educational jargon. This long phrase has been used in lieu of 'basic education'. As a scheme of instruction, basic education did indeed represent an organisation of formal courses aimed at training the child in a productive craft, but the point could have been made more simple.

The reason for the EC's choice of an indirect, opaque reference to basic education is easy to surmise. It is simply the need to be politically acceptable. The association of Mahatma Gandhi's name with basic education had given it a halo and an extraofficial status. It is not that progress in introducing the basic approach had achieved extraordinary speed anywhere, but the effort had had consistent official support and access to Plan funds. All of the first three Plan documents had discussed basic primary education with enthusiasm and a certain degree of imagination. The Second Five-Year Plan document (1956-61), for instance, had mentioned the need to link basic schools with development activities taking place in the village. The Third Plan document (1961-66) repeats this and records the intention of converting all teacher training institutions into the basic approach. In contrast to this enthusiasm, the draft outline of the Fourth Plan, published in August 1966 - that is, two months after the submission of ECR - has just a one-line mention of basic education: 'Basic education will be strengthened by developing carefully selected schools and introducing in other schools work-oriented curricula and citizenship training' (p 314). This mention is consistent with the line taken by ECR in another section which we will presently discuss, namely, that of replacing basic education with 'work experience', suggesting that the two are the same. But even this brief mention of basic education disappeared in the final Fourth Plan document.

The dispensability of Gandhi and his approach to education had a wider context. By the mid-1960s the legitimacy of Gandhi's perspective on development was reduced to

the minimum. It is a well-grounded popular belief that Nehru's perspective on India's development was antagonistic to that of Gandhi. In a recent review of Nehru's policies, Parekh (1995) has argued that in the later part of his prime ministership, Nehru grew somewhat receptive towards the priorities and institutions associated with Gandhi. If this reading has validity, Nehru's death marked the end of whatever token presence Gandhi's recalcitrant legacy had in the highest decision-making structures. In any case, the war with China had given a strong impetus to these structures for moving towards untrammelled modernisation of defence and defence-related scientificindustrial infrastructure. Needless to say, the urban intelligentsia, including the bureaucracy, agreed on this matter with the leaders of industry and trade.

Many other changes took place in the early 1960s, symbolising the impending end of Gandhi's utility as a reference point for determination of policy. In education, the setting up of the National Council for Educational Research and Training (NCERT) in 1962 marked the closure of a period in which Gandhi's ideas in education were held as being important. The opening of central schools to cater to the needs of union government functionaries transferrable throughout the country, and the establishment of the Central Board of Secondary Education (CBSE), were in harmony with the emerging ethos. These steps had a functional rationale, but they also had latent symbolic significance. They marked the consolidation of a national elite and the grant of freedom to it to transcend the constraints of local or provincial socioeconomic realities. Their existence made the problems of decentralised planning in education - which had axiomatic importance in Gandhi's approach - look irrelevant to progress. The use of 'national' and 'central' in the naming of these organisations permitted a disproportionate amount of funds to be spent on a privileged section of society. The naming also allowed them to tighten their hold over the symbolic inheritance of colonial rule. This process of the final transfer of colonial symbolic assets to a national elite was most visible in the context of language. Contrary to the recommendation of every panel ever set by the government over the question of medium of instruction, the NCERT, the central schools, and the CBSF were able to patronise English whose continuation as an associate official language of the union was ratified in 1967. The use of English by these institutions had a functional justification, but the symbolic underpinnings of this justification were far more significant if seen against the background of the political and economic forces vying to shape the Indian nation in the 1960s.

Writing of the ECR was a part of this process of the creation of a national discourse on development. Its common-sense value lay in the fact that India needed a national system of education just as it had a national system of railways, postal services, and so on. What made the task in education somewhat inconvenient was the climate created by Gandhi's idea of basic education, although the Zakir Hussain Committee had tried to give a 'national' label to it at the time of its inception. Both as an ideology and as a scheme of instruction, basic education was not compatible with the demands that a nationally organised system might make Ideologically, it was supposed to be sustained by local communities, local markets and the local environment. As a scheme of instruction, it was rooted in the idea that learning arises out of children's interaction with the real world in their immediate vicinity. This interaction was supposed to be guided and enriched by the use of the local language, locally available material, and the teaching of locally practised productive skills. The teacher's active membership of the community was assumed, and where it was not possible (as in the case of someone brought in from elsewhere), a teacher was expected to achieve it by personal effort and participation. It was mainly due to this concern that housing for the teacher was considered an essential part of the school design.\* Clearly, the concept of basic education could not be an attractive proposition for investment of scarce resources from the perspective of the planners of 'national' development.

The phasing out of basic education is explained with a little less tight brevity elsewhere in the ECR. In Chapter VIII, which is about school curriculum, the reason why basic education needs to be substituted by the incorporation of work-experience in a general academic curriculum is mentioned:

The programme of basic education did involve work-experience for all children in the primary schools, though the activities proposed were concerned with the indigenous crafts and the village employment patterns. If in practice basic education has become largely frozen around certain crafts, there is no denying the fact that it always stressed the vital principle of relating education to productivity. What is now needed is a reorientation of the basic education programme to the needs of a society that has to be transformed with the help of science and technology. In other words, work-experience must be forwardlooking in keeping with the character of the new social order (p 351).

This commentary suggestion that basic education was deficient in two respects: in getting confined to certain crafts, and two, in being incompatible with the promotion of science and technology. The list of work

experiences given by the EC is indeed long, consisting of some 16 activities for lower and upper primary stages alone. The last item on this list is 'work in the farm' (p 364). The chapter on agriculture and education, which we have discussed earlier, also mentions the need to orient the school curriculum towards agriculture, even in urban schools. This was supposed to be done not by introducing agriculture as a subject, but rather by orienting the existing courses in general science, biology, social studies and mathematics towards the rural environment and the problems facing 'the Indian community' (p 660). These discussions do look a little incoherent, but the point conveyed is clear; that a curriculum structured around the ideological preferences of basic education will be replaced by a general academic curriculum in which the experience of productive work will be given a place of sorts. The image of learners implied in this new alternative is that of 'forward looking and progressive farmers' whose prototype, as we noted earlier, were to be found amongst "the third of the cultivators who now own more than half of the agricultural land" (p 661) They were to serve as the initial demonstrators of the many financial benefits of the package known as 'improved farming practices; which included chemical fertilisers, pesticides, hybrid seeds, and the new farming machinery

Our analysis implies that in the new climate of rural development priorities which the EC anticipated, the idea of equal opportunity was to be confined to education; in the material context, the decision to give greater opportunity to the richer farmers had been taken. Its justification lay in the rhetoric which projected self-sufficiency in food as an isolated objective, and the application of science and technology - both in the form currently recognised by American agrobusiness-research apparatus - as the sole means of achieving it. Thus, a sharp mismatch was enforced, planned deepening of inequalities in the material opportunity structure, and the projection of meritocratic equal opportunity in education. It is hardly surprising that the former plan made the latter thoroughly invalid. The green revolution strategy did indeed achieve selfsufficiency in one area of food supply, namely cereal, but it exacerbated the stratification of rural society, most glaringly in the parts of the country where it was applied most intensively, but elsewhere too. It pauperised the middle-range peasant and forced the smaller peasant to become a landless labourer, a likely migrant to an urban slum. The trend was clear within the first few years of the implementation of the agricultural modernisation strategy. By the time the 1971 census was taken, the proportion of agricultural labourers in the rural population had increased by as much as 11 per cent over the last census: from 18.8 per cent to 29.9 per cent. As a commentary by Mehta (1973) noted, India was witnessing a concentration of land rather than its redistribution.

Destitution of the landless and small peasants, and prosperity of the big landowners became the norm, leading to, and being reinforced by, the increasing dominance of the large landowners in politics. The changes introduced in agricultural policies in the mid-1960s made a critical difference to the means by which the richer farmers could exercise their hegemony over the rest of the village population. The changes that benefited them most included the provision of support prices by the government for agricultural products, availability of credit for purchase of hybrid seeds, chemical fertilisers, and farm machinery, and subsidies on the sale of fertilisers. The precise manner in which the bigger landowners (in many parts of the country they were the exzamindars and members of princely families) dominated the village political scene so as to corner the lion's share of state benefits and new commercial opportunities differed from state to state. The picture in the Vindhya-Gangetic belt of the north was close to the one Srilal Shukla portrayed in Raag Darbari (1968). The portrayal focuses on the absolute hold of a single family on the village cooperative society, the gram sabha, and the governing body of the local college. Drawing on a case study of a village in the North Arcot district of Tamil Nadu, Kurien (1992) has depicted the emergence of new dependencies even as old ones were getting eroded owing to the changes in agricultural prductivity. The new agriculture requires stable sources of water. Commercial selling of water by well-owners, according to this study, has sharply enhanced their power and status.

One other aspect of the ECR's support for agricultural modernisation that was being intensified in the mid-1960s is relevant to this discussion. In its opening chapter discussed earlier, the ECR had talked about the goal of providing every citizen with a balanced diet, without specifying what a balanced diet might mean. It appears that the concept of diet was changing in the 1960s. mainly on account of changes that were occurring in the culture of farming. Escobar (1995) has cited nutrition and balanced diet as important items of the post-war discourse of international development agencies, the World Bank, and USAID. Lack of scientific knowledge about nutritional requirements of the human body was projected as a major cultural deficiency responsible for poor socio-economic development in third world societies. A vast battery of adult education primers, school textbooks, extension services and media programmes was pressed into service in order to tell people what they must do to make their diet balanced. Inevitably, the exhortation revolved around the need to include eggs, meat and mitk so that the diet would have enough protein. Conspicuous

Dy its ausence was the mention of pulses, and we can guess why. Even as the new, scientific 'knowledge' of balanced diet was spreading, the most important source of balance in the Indian diet was diminishing under the auspices of the green revolution. Bardhan has pointed out that in the postgreen revolution period the "production of pulses, a major source of protein for the poor, has largely been stagnant" (1984: 11). Between the early 1960s and the early 1970s the area under pulse cultivation declined by two and a half million acres, resulting in a drop in the per capita availability of pulses." To fully grasp the meaning of this phenomenon, we need to recognise that pulses facilitate the absorption of cereal protein by providing amino acids which complement the ones found in cereals such as wheat and rice. It is the combination that makes the protein available in a cereal-pulse diet balanced. Lappe and Collins (1978) have called it 'usable' protein and have treated it as an index of the quality of protein. They say:

Thus, if green revolution displaces legumes in the traditional diet, not only does the overall protein intake fall, since legumes have two or four times the protein content of grain, but just as critical, the *balanced combination* of grains and legumes that improves the biological usability of protein is also undercut (1978: 153)

From this perspective, we have not even begun to perceive the nutritional impact of the agricultural modernisation strategy associated with the green revolution. The reason why this strategy proved so detrimental to pulse production was at least initially the simple fact of farmers being coaxed to devote their best lands to high-yielding varieties of wheat and cash crops. With the increase of canal irrigation, seepage made a great number of pulse producing areas unfit for this purpose.

#### CONCLUSION

The EC had talked about a "larger way of life and a wider variety of choices" (p 33) as a major promise of modernisation. The changes brought about in people's dietary options - we have examined just one out of many - by the green revolution strategy of agricultural modernisation can be seen in that manner too, and the nutritional implications of these changes can be ignored or treated in a simplistic manner. That would be in keeping with the style of analysis customarily applied to India's agricultural modernisation in the context of the use of chemical fertilisers, pesticides, and hybrid seeds which depend on them and on heavy irrigation. Barring exceptions, 10 agricultural economists have treated an increase in fertiliser use per acre, for example, as an indicator of progress, completely ignoring on the natural fertility of the soil. Nadkarni (1991) has noted the recent trend of decline in the rate at which productivity of land had increased in the early phase of the intensive use of chemical fertilisers. It is a disturbing fact that economists have generally failed to show an interest in such obvious aspects of agricultural and economic growth as depletion of the physical environment, the misery caused by displacement of massive numbers of people due to large-scale irrigation schemes involving big dams and canal works, and migration to metropolitan slums as a result of pauperisation.

Given the narrow limits within which the process of India's agricultural modernisation has been examined, it is hardly surprising that its impact on children's lives has not been a subject of discussion or debate.11 This paper has made an attempt to show how the EC's wholesale espousal of the modernisation package involved the jettisoning of basic education in favour of a return to general, academic elementary education. It can be argued that the EC was advocating a new type of general elementary education for rural children, not a return to the old colonial mode which basic education had started to erode. It can also be argued that EC's modernist vision of an activity. centred academic education for rural children did not materialise because of inadequate funds and the lack of political will. A commitment to educational development by the state and central governments was one of the assumptions made by the EC; a stable political environment was another major assumption.12 If these assumptions proved false, we can hardly blame history for that; rather, we must ask if the purely normative discourse of educational planning, which the EC exemplified in such perfection, is a valid preparation for change. In the absence of a realistic estimate of what could be expected in the emerging socio-economic and political scenario in the mid-1960s, the general and academic elementary education programme recommended by the EC in place of basic education certainly proved detrimental to the spread of education in rural India. The persistence of a high dropout rate, with almost no change in over three decades which have passed since the submission of EC, is a proof of this conclusion, although its detailed verification must wait for further research.

#### Verrier Elwin and the Tribal Question in Late Colonial India

#### Ramachandra Guha

In the huge collection of the records of the All India Congress Committee, housed at the Nehru Memorial Museum in New Delhi, one is hard put to find a reference to tribals – this in contrast to the attention paid to women, untouchables and religious minorities. Curiously, this absence in the official nationalist archive is reproduced by the radical historiography of our times, which – like the Congress nationalists it sets itself in opposition to – has had scarcely a word to say about tribals, this in contrast to the dozens of exegeses, scholarly and polemical, it has provided on the prehistory of the communal question, the caste question, or the women's question.

In addressing this neglect, the present essay approaches the tribal question in colonial India through the work and writings of Verrier Elwin. By 1940 or thereabouts, Elwin had become the most important single influence through whom urban Indians had got to know of their tribal countrymen: their culture, their way of life, their poverty and their vulnerability. His work for the tribes was widely known and widely discussed, fervently praised as well as vehemently attacked. This essay outlines Elwin's invention of the aboriginal and his forgotten but not necessarily irrelevant debates with social workers, anthropologists and missionaries working on or with adivasis.

I

N 1932, a radical English priest and writer noved to a village in central India to commence social work among Gond tribals. A dissenter within his Church, an admirer of Mahatma Gandhi who saw himself as a British-born Indian', Verrier Elwin had come to serve the most disadvantaged and east visible of India's poor. In an early essay rom his new home, Elwin called attention o the neglect by the national movement of he predicament of the tribes. 'Hill and forest ribes', he remarked, were a 'despised and callously ignored' group. Their problem was as urgent as that of the untouchables: society and sinned against them as grievously, and vet

the one has become a problem of all-India importance: the other remains buried in oblivion. Indian national workers and reformers – with the exception of the heroic little band associated with the Bhil Seva Mandal – have neglected the tribes shamefully. The Congress has neglected them. The Liberals have neglected them. The Khadi workers have neglected them.

Two years later, the British parliament passed the Government of India Act of 1935. This act was designed to hasten the transition to self-government, in the first place through the constitution of provincial legislatures and ministries based on a limited franchise. But the act also contained two provisions whereby certain tracts, with predominantly tribal populations, were to be known as 'Excluded' and 'Partially Excluded' areas. These areas were to be insulated from the control of the Indian legislatures and ministries, and left in direct charge of the governor of the province (always British, usually an ICS officer).

Some British politicians saw the provisions as vital in protecting the tribals from their Hindu neighbours. Conservative MPs, supporting the clauses in the House of Commons, said they would save the tribes from 'being converted from good Nagas or whatever they are into had Hindus'. But the tribals were not to be deprived of the 'decencies of Christian civilisation'. As one member, Colonel Wedgwood, put it, "the best hope for backward tribes everywhere are the missionaries. The missionaries and the British government together give these people a chance". Winston Churchill, that doughty opponent of freedom for subject peoples, made common cause with these MPs. "I take as much interest in the fortunes of the white people in India", he remarked, "as I would in these backward tribes. I feel just as disturbed about their police and security being handed over to a Government which I do not trust as the anthropological party represented here... are about the handing over of the backward areas to a Government they do not trust, so that we are almost in the same party in this respect".2

The creation of excluded areas, with their motivations thus made explicit, raised a storm in nationalist circles. A meeting of the Congress, held at Faizpur in September 1936, condemned it as "yet another attempt to divide the people of India into different groups, with unjustifiable and discriminatory treatment, to obstruct the growth of uniform democratic institutions in the country". When the Congress formed provincial ministries in 1937, it tried hard to abolish or dilute these provisions. The Bombay legislative assembly, in a unanimous resolution, said it was "outrageous to suggest that a constitutionally irresponsible Governor, almost certainly a non-Indian, can better adminster these areas than a responsible Indian Cabinet can". The concept of excluded areas was even mocked as a device of anthropologists to protect aboriginals as museum pieces for their science.

Without perhaps intending it, the Government of India Act was thus to spark a wideranging debate on the future of aboriginals in a free India. How could one appropriately define aboriginals and understand their culture and way of life? How were their interests to be best protected? At what pace and in what way should the state allow the contact of aboriginals with the outside world? What were the respective roles in this regard of administrators, politicians, anthropologists, missionarics and social workers?

These were the questions that lay behind Verrier Elwin's own work between 1935, when the government of India Act was passed, and 1947, when India became an independent nation. They are most evident perhaps in The Aboriginals (1943), a polemical tract directed at a wider public, yet Elwin's more scholarly studies also close with appeals to the future rulers of free India. The Barga (1939), a book that passionately defends the rights of tribals who practice 'bewar' (swidden agriculture), asks 'those who believe in Home Rule' to 'see to it that the original owners of the country [i e, the aboriginals] are given a few privileges'; in this case, the full freedom of the forest. The last paragraph of The Agaria (1941) - a sympathetic account of a tribe of charcoal iron-smelters crippled by high taxes and the coming in of modern steel - commends to Indian politicians the compassion shown to forest tribes by the great Emperor Ashoka. Even The Muria and their Ghotul (1946) unlike the other two books, in its theme far

removed from matters of state policy—suggests that the Indian ideal of human love lies equally behind the tribal dormitory (ghotul) as it does behind ancient Hindu sculpture and painting—the hills and forests where the ghotul held sway "hold a rich human treasure, natural to [India's] soil, part of her great culture".5

But in the run-up to Indian independence, it was not Elwin alone who was concerned with the tribes. After the elections of 1937, Congress governments, while urging the scrapping of 'Excluded Areas', commissioned a series of reports on the condition of the tribes, in belated recognition of a long neglect. Christian missionaries and university anthropologists also contributed to this spurt of interest, while in Bihar a militant movement to distinguish aboriginals from Hindus was taking shape under Jaipal Singh, a tribal who had been up at Oxford at the same time as Elwin. Here were many different points of view with regard to the tribes, and many different social agendas. It was a situation that lent itself to conflict and controversy, as Elwin was to find out.

The controversies of the 1940s were to bring to centre stage the predicament of a people till that time ignored by social workers and politicians alike. In the huge collection of the records of the All India Congress Committee, housed at the Nehru Memorial Museum in New Delhi, one is hard put to find a reference to tribals - this in contrast to the attention paid to women, untouchables and religious minorities. Likewise, Pattabhi Sitaramayya's golden jubilee History of the Indian National Congress (published in 1935) contains no more than a fleeting reference or two to tribals, although the problems of women, lower castes and communal harmony are covered in depth. Curiously, this absence in the official nationalist archive is reproduced by the radical historiography of our times, which -like the Congress nationalists it sets itself in opposition to - has had scarcely a word to say about tribals, this in contrast to the dozens of exegeses, scholarly and polemical, it has provided on the prehistory of the communal question, the caste question, and the women's question.

In addressing this neglect, the present essay approaches those old, forgotten but not necessarily irrelevant debates through the work and writings of Verrier Elwin. By 1940 or thereabouts, Elwin had become the 'most important single influence' through whom urban Indians came to know of their tribal countrymen: their culture, their way of life, their poverty and their vulnerability. His work for the tribes was widely known and widely discussed, fervently praised as well as vehemently attacked. In one of those paradoxes in which the history of anthropology abounds, it fell to this one-

time Oxford don to formulate the tribal question in its most striking and contentious fashion.

#### II

"The noble savage of North America is a very different character from the poor squalid Gond of central India: and not even the genius of a Longfellow or a Fenimore Cooper could throw a halo of sentiment over the latter and his surroundings". Thus wrote James Forsyth, the soldier, forester and amateur ethnologist who roamed the hills of the Central Provinces in the middle decades of the last century.7 Verrier Elwin, who travelled in the tracks of Forsyth and often quoted him, was at first inclined to go along with this assessment. His early sketches of village life are conspicuous for their absence of sentiment, their stress on what the aboriginal\* lacked rather than what he possessed. Take these verses from a poem written in the early 1930s, about a four-yearcld Gond girl who cannot go to school but must work from dawn to dusk in the fields:

The luscious sweet she cannot taste, No joy she'll ever see; A scanty rag about her waist Is her sole finery.

And once I saw her stagger home Beneath a load of wood Laid on her back, so burdened that As though upon the Rood

Before that little child I saw The form of one who bowed Beneath another load, and walked Amidst an angry crowd.

Elwin's first writings from Mandla are marked by this Christian belief that the meek shall inherit the earth. The Gonds are dignified, if at all, by their suffering and quiet courage in the face of adversity. For this Englishman had come to the forest as an Improver, attempting to 'teach a primitive group the best things about civilisation'.10 His agenda borrowed freely from Gandhism and from European traditions of social work, incorporating temperance, education, health and sanitation - premised on the belief that the Gonds had all to learn and little to teach. But the more he lived with and among tribals, the more Elwin came to view their culture in positive terms. Behind this transition lay a growing familiarity with their language, a fuller appreciation of their life and thought, and perhaps most decisively, his marriage, in April 1940, to one of them. Within a decade of his move to Mandla, Elwin had put in place his incisive critique of modern civilisation - and corresponding regard for tribal values - that was to become his trademark. Although he remained deeply pessimistic about its future, there is little doubt that in his later portrayals of aboriginal tite he succeeded in throwing a halo of sentiment over it. His personality also underwent a transformation: once a moralising ascetic, he came to absorb the gaiety and zest for life of the people he lived with. The creeds of the Anglican Church and the Hindu Mahatma were both rejected in favour of a whole-hearted identification with the culture of the tribes.

A self-taught and self-trained anthropologist, Elwin ranged widely over the Indian heartland, studying and writing about tribes in the British-ruled territories of Orissa, Bihar and the Central Provinces, as well as the large tribal chiefdom of Bastar. His travels bore fruit in a series of ethnographies and folklore collections for 'academic' consumption, and in numerous policy pamphlets, reports, and newspaper articles for a more general audience (he also published two novels). Through all of this work runs a contrast between the 'pure' and the 'decayed' aboriginal, the latter corrupted by contact with civilisation. Elwin himself does not offer, in any one place, a succint definition of the first type, whom he both admired and identified with. In constructing a picture of Elwin's 'pure' aboriginal, I have relied almost exclusively on his writings in the years leading up to Indian independence (roughly, 1939 to 1947). This was a time when he came to regard himself as a spokesman not merely of the Gonds of Mandla, but of the 20 million tribals of central India.

#### Ш

Mr Verrier Elwin Deserves and may well win Renown in the world of letters For recording the life of our moral betters.

Bombay journalist, c 1940

Perhaps the first thing that distinguished Verrier Elwin's aboriginal was his love of Nature. The forest provided him food, fruit, medicine; materials for housing and agriculture; birds and animals for the pot. The significance of the forest was economic as much as cultural, practical as well as symbolic. All tribals had an intimate knowledge of wild plants and animals; some could even read the great volume of Nature like an 'open book'. Swidden agriculturists, for whom forest and farm shaded imperceptibly into each other, had an especial bond with the natural world. Both the Baiga and the Muria liked to think of themselves as children of 'Dharti Mata', Mother Earth, fed and loved by her. The forest was also a setting for romance, the ideal trystingplace for lovers. The Gond's idea of heaven was 'miles and miles of forest without any forest-guards'; his idea of hell, 'miles and miles of forest without any mahua trees'.11

Elwin's ethnographies are peppered with

reterences to the aboriginal's love for the forest, a 'world which is as varied as human life'. Contact with the abundance and variety of nature might, indeed, still human feelings of competition and envy. In one of his novels, a group of villagers go on an expedition to pick wild mangoes from the jungle. At day's end, 'half the village was sucking mangoes; the voice of envy and scandal was hushed; there were no quarrels that day; the witches rested from their labours; they were possessed by the wild free spirit of the forest, filled with delight in the most precious of its fruits'. 12

The high place of their women also set the aboriginals apart from more civilised societies. Among the Mandla Gonds (whom Elwin knew best of all), the woman was 'the real ruler of the house'. As for the Baiga woman, "she generally chooses her husband and changes him at will; she may dance in public; she may take her wares to the bazaar and open her own shop there...; she may drink and smoke in her husband's presence" – freedoms all generally denied to the caste Hindu woman.<sup>13</sup> Here the Baiga were no exception, for in most tribal societies

the woman holds a high and honourable place. She goes proudly free about the countryside. In field and forest she labours in happy companionship with her husband. She is not subjected to early child-bearing: she is married when she is mature, and if her marriage is a failure (which it seldom is) she has the right of divorce. The lamentable restrictions of widowhood do not await her: should her husband die, she is allowed, even enjoined, to remarry: and in many tribes she may inherit property. Her free and open life fills her mind with poetry and sharpens her tongue with wit. As a companion she is humourous and interesting; as a wife devoted; as a mother, heroic in the service of her children.14

This. apparently, was a feminism almost fully realised. It explained in turn the open, unaffected attitude of the aboriginal towards sex. Working with the Baiga, Elwin was struck by the absence of sexual dreams. He traced this to the culture of the tribe, where 'the fine and delicate perceptions and delights of a moderate sexuality are preserved', this in contrast to the 'middle class, Puritan European atmosphere in which Freud formed his theory of repression and the interpretation of dreams'.15

These themes are developed more fully in the 700 pages of *The Muria and their Ghotul*. Here the anthropologist presented the village dormitory – to civilised eyes a bed of sin and promiscuity – as the ideal preparation for stable, adult marriage. In the ghotul, sex was playful, the best of all games; neither too intense, nor defiled by possessiveness and jealousy. Unlike in more complex societies where many marriages

fell apart on the first night, among the Muria both husband and wife, finely trained by the ghotul in the sexual arts and virtues, were fully prepared when they crossed the threshold. Moreover, tribal practice tended to confirm the position of the woman. Where in Europe sex was regarded as the man's privilege and the woman's duty, in aboriginal India sex was more often the man's obligation and the woman's right, her 'compensation for the embarassment of menstruation and the pains of child-bearing'.

The exuberant love of children also marked out the aboriginal from the Hindu and the European. 'The child is the God of the house', said a Baiga woman. 'The greatest love in the world is the love of children', said a Baiga man. Fathers were often to be seen carrying a child in their arms, kissing and fondling it. The child of the forest grew up to dread not the father (who was no kind of tyrant) but forest guards, police officials, and ghosts. The tribals' demonstrative love for children, and their tolerance of misbehaviour, were in contrast to the austere aloofness of the European adult. Nor did the tribals have any of the Hindu's passionate longing for boys, adoring, equally, babies of either sex. As for the children themselves, they exhibited, early on, the absence of the acquisitive instinct. Arriving in a village with a box of toys, the anthropologist found that "none of the Gond children show signs of wanting to possess toys for themselves, but the more sophisticated Hindu children, however, weep vociferously on finding they can't have them'.17

The anthropologist was also attracted by the fundamental longing for unity and solidarity which permeated aboriginal life. This was expressed in the great festivals where the tribals ate, drank, sang and danced together, and in other ways too. The Baiga village, where all houses were built around a common square, exemplified for Elwin the 'friendly, open-hearted, honest communistic nature of the tribe'. The Muria ghotul was a 'compact, loyal, friendly little republic', its members united by a 'large, generous corporate romance'. For the aboriginal, tribal solidarity was the 'supreme good', individualism the 'great sin'. Thus the absence of theft, adultery, quarrel or the shirking of work, of anything that might threaten or undermine the unity and collective interests of the community. is

In the aboriginal India of Verrier Elwin's presentation, fraternity went hand in hand with equality. "In the spirit of economic fellowship and the tradition of communal living', he once remarked, "some primitive villages are a hundred years ahead of the modern world". Economic assets like land were, in general, equally distributed or held in common. More striking was the spirit of political equality, with decisions affecting

the village or tribe taken by consensus rather than by a single spokesman. Here too the ghotul was a microcosm of a wider belief, where "everyone is equal, rich or poor, the son of priest, headman or landlord, all are one in this fellowship which knows no wealth-distinction or privilege of inherited rank". 19

Equality, yes, but not a dull uniformity. The cultural richness of tribal life was manifest in their varied forms of recreation - numerous games of their own devising, story-telling, poetry, art, and, above all, music and dance - all of which "enliven village life and redeem it from the crushing monotony that is its normal characteristic in other parts of India". The Muria of Bastar might appear poor to the outside eye, but in fact they had a "full rich life: every day brings its delightful and absorbing pursuits; at least twice a month there is a sharp break in the monotony, the colour and music of a festival, the excitement of a hunt, the romance of a dancing expedition - and all the time, if you are young, there is the ghotul which you would not exchange for any offer of material wealth".20

The gaiety of aboriginal life came through most vividly in their love of the dance. The dance was in itself an index of the vitality of tribal life: without it, wrote Elwin,

tribal life sinks into utter monotony. The tribesmen like their recreation to have a kick in it, and they find small consolation in missionary tea-parties of Congress meetings to discuss agricultural reforms. Without the dance, the tribesmen is overwhelmed with boredom, he is swallowed by his work and his anxieties, there is no tower into which he can escape. 21

These are then the core elements in Elwin's celebration of tribal life: the identity with Nature, the honoured place of women, a joyful attitude towards sex, the love of children, a strong sense of community and equality, gaiety and variety in forms of recreation. This celebration was at the same time an indictment both of modern Western civilisation and Hindu caste society, cultures characterised by the oppression of women, social hierarchy, the spirit of competitiveness, aggression, and sexual repression. As Elwin wrote in 1943, Indian tribesmen

do not cheat and exploit the poor and the weak. They are mostly ignorant of caste and race prejudice. They do not prostitute their women or degrade them by foolish laws and customs. They do not form themselves into armies and destroy one another by foul chemical means. They do not tell pompous lies over the radio. Many of their darkest sins are simply the result of ignorance. A few of them are cruel and savage, but the majority are kind and loving, admirable in their home, steadfast in their tribal loyalties, manly, independent, honourable 22

this is in fact the last paragraph of a book on murder and suicide among the Maria Gonds of Bastar. When dealing with the darker side of tribal life, Eswin liked to put matters in perspective, by contrasting aboriginal practices with civilised ones. For him, the rigour of the witch-hunt or the punishment for witch-craft among the Baiga (usually a beating) could not 'match the savagery of the Middle Ages in Europe'. Likewise, the punishment for violating the rules of the ghotul merely involved the loss of dignity with only a little discomfort: absent was the 'sharp, abrupt sting of corporal punishment so familiar to the European schoolboy', intolerable to the gentle Muria would be 'the catastrophic decisiveness of a flogging'. Again, where in modern society murders were overwhelmingly for gain, among Indian aboriginals they originated in disputes over rights and privileges (whether over land or women), 'rather than as a desire for possession'. In a characteristic comment on the hypocricy of the civilised, he notes: "We today regard it as a great crime to kill our own fathers and children: but even the most civilised European nation - whichever that might be - regards it as rather glorious to kill the fathers and children of others in war".23

To the civilised mind, primitive society is violent in the extreme - plagued by endemic strife, lacking the orderly rules of conduct and humane values believed to be the hallmark of our own society. Writing in the midst of the most savage war in human history, Elwin could neatly turn conventional wisdom on its head. In his view the aboriginal was more likely to be peaceful and uncontentious, modern man more predisposed to killing and brutality. Thus the Nagas shared with the advanced nations of Europe the customs of head-hunting and human sacrifice, with this difference: 'that the poor aboriginal sacrifices only one or two human beings in the name of his gods, while the great nations offer up millions in the name of empire and enlightenment'. In his study of primitive iron-smelting, published in 1942, Elwin contrasted the 'millions of tons of death-dealing steel employed in modern battle' to the 'few thousand tons smelted annually in the clay furnace, of central India, used to make ploughs and harrows that raised rich crops in the Markal Hills. "This aboriginal iron has brought the law of plenty to the jungle", he remarked, while "that civilised iron is bringing the law of the jungle to the lands of plenty".24

The Baiga, remarked Elwin in his great book on that tribe, 'know little of civilisation and think little of it'. He himself knew a great deal about civilisation, and yet thought little of it. In this sense he might be said to exemplify the ideology of 'cultural primitivism', defined by A O Lovejoy and

George Boas as the 'discontent of the civilised with civilisation, or with some conspicuous and characteristic feature of it'. 25 Primitivism has of course been one of the most enduring strands in European thought; in the words of a recent commentator, Tzvetan Todorov, it is 'less the description of a reality than the formulation of an ideal'. 26

Elwin's own espousal of cultural primitivism was not, of course, wholly an invention. For one thing, the Gond, the Baiga and the Agaria all believed that the past had been better than the present, that there had truly once been a Golden Age when their kings ruled, their powers of magic and healing were unimpaired, their beloved bewar and iron smelting freely pursued. Elwin's attack on civilisation was also splendidly timed, for with the long shadow of Nazism cast across the warring nations of Europe, the primitivist could effectively challenge a view of human progress in which savages in the forest were placed at the bottom of the hierarchy and modern European society at the apex.

Most of all, Verrier Elwin is to be distinguished from other primitivists in that he actually lived with the communities whose culture he so vigorously celebrated. For the narrator of primitivist reveries has always had the choice 'to return, at the end of his sojourn, to the highly civilised countries he came from'. From Vespucci to Chateaubriand down to the anthropologists of the 20th century, the European traveller in search of the exotic invariably goes back to where he came from.27 But Elwin was a different type altogether, who lived with the primitives, loved with them, and therefore defended them. Strikingly, Elwin recognised both the tradition he came from as well as his departure from it. He once remarked, with regard to the fascination for the primitive of European poets and philosophers, that "not many of those who wrote so eloquently of the return to nature were prepared, however, to take the journey themselves, at least not without a return ticket".28 He was one of the very few who did.

#### IV

The undermining of old-established authority, of tribal morals and customs tends on the one hand completely to demoralise the natives and to make them unamenable to any law or rule, while on the other hand, by descroying the whole fabric of tribal life, it deprives them of many of their most cherished diversions, ways of enjoying life, and social pleasures. Now once you make life unattractive for a man, whether savage or civilised, you cut the taproot of his vitality. The rapid dying out of native races is, I am deeply convinced, due more to wanton interference with their pleasures and normal occupations, to the marring of their joy of

life as they conceive it, than to any other cause.

#### Bronislaw Malinowski

At the time of which I write, the 1940s, the 'primitive' and the 'civilised' were not merely two alternate worldviews, but two social systems coming into continually closer contact. This was a hopelessly one-sided encounter, in which the aboriginal stood to lose his lands and his forests, his culture and his self-esteem.

Wherever he roamed in Bastar, the Central Provinces or in Orissa, Verrier Elwin discovered deep differences between tribal communities relatively untouched by the outside world and those that had been radically affected by it. In the Orissa districts of Ganjam and Koraput he found one class of aboriginals who were "poor, miserable and diseased... They have lost their standards; they no longer have the beauty and dignity of an ordered coherent culture to support them; they are adrift in a modern world that so far has done little to afford them anchorage". But travelling in the interior hills one got "a very different picture. Here we find living in almost unfettered freedom and in the enjoyment of ancient and characteristic institutions some of the most ancient people of India... These people have maintained their morale and their will to happiness. Geographical factors have protected them and still contribute much to their well-being".

Sometimes one found this contrast amongst different sections of the same tribe. Thus among the Baiga it was

most instructive to go straight from a bewarcutting jungle village in the wilds of Pandaria to a village by the roadside in Mandla or Niwas. In the former, tribal life and organisation still retains its old vitality; you enter the village and at once you feel the stir and throb of communal energy; tribal life is an integrated whole, it makes sense, there are no gaps in it, it has no insulated spots, everything is related and functions in its proper place. The people are vigorous, independent, happy. But go to a semicivilised Baiga village in Balaghat, Mandla or Niwas. The people might belong to another race. Servile, obsequious, timid, of poor physique, their tribal life is all to pieces. Parts of it, like the right to hunt and practice bewar, have been torn out by the roots. Some of their simple and innocent dances, under Hindu influence, have been given up. The souls of the people are soiled and grimy with the dust of passing motor-buses. In the village, you are in the midst not of a living community but of a collection of isolated units. Tribal life and tradition appear slightly ludicrous, even to the tribesmen themselves. And once that point is reached there is no hope for the tribe. 40

It was only the tribal isolated in the highlands who really lived; his religion

haracteristic and alive, his social rganisation unimpaired, his traditions of art nd dance unbroken, his mythology still ital. "It has been said", wrote Elwin in July 943, "that the hoot of the motor-horn would ound the knell of the aboriginal tribes as uch; but now petrol rationing has stepped n to delay the funeral". In the "old days when there were neither roads nor motorars", he was told by a Bastar tribal, "the Auria were honest, truthful and virtuous"."

Even where their souls were not soiled vith the grime of passing motor-buses, the boriginals were assaulted by civilisation in numerous other ways. British economic olicies, favouring individual titles to roperty and creating a market for land, had elped dispossess thousands of tribal families ind placed many others in a position of ondage to money-lenders. Forest and game aws had sharply reduced the access of the boriginal to the fruits of nature, and in some nstances (as where shifting cultivation was anned) deprived them of their livelihood ltogether. The suppression of the home listillery, forcing the tribal to buy alcohol iquor only from outlets licensed by the tate, had brought him into contact with a nost 'degraded type of alien', the liquor ontractor. The Indian Penal Code and the ndian Forest Act formed two pillars of a nassive, alien system of jurisprudence which an counter to tribal custom, subjecting them o endless harassment at distant courts, at he hands of lawyers, lawyer's touts, and illnformed judges. 12

Where colonial policy worked thus to mpoverish the aboriginals, Hindu society, where it did penetrate tribal areas, attacked heir culture with equal ruthlessness. Extended contact with Hindus crushed the iboriginals' love of art, music and dance; aught them to worship alien gods and have ontempt for their own; introduced childnarriage; constricted their 'generous hearts' with the practice of untouchability; and incouraged them to put their free and happy women in purdah."

This collective deprivation had resulted in in acute psyschological trauma, a 'loss of nerve'. Facing economic decline and the nostility of the state, the Agaria dreamt that when he dug for iron he came up with stones nstead. The Baiga attributed the decline of nis powers of magic to having to take, forcibly, to the plough and 'settled' cultivation. Most cynically of all, the Mandla Gond believed that when the railway came. 'Annadeo, the God of food, ran away from he jungle. He sat in the train and went to Bombay, and there he makes the [city] people fat". This was a world in which the livelihood of the aboriginals had been taken away, their culture crushed, and where even the gods nad turned against them. 'Abika raj kalau, arka larki malau' (The world of today is black, our boys and girls are like monkeys, degraded) remarked a Muria of Narayanpur, a comment that sums up Elwin's own view of the clash of cultures in aboriginal India.

#### V

But how tired I get of this abominable civilisation. I often read that the next war will mean the end of European civilisation Well, will that matter!

Verrier Elwin, in a letter to his mother, August 22, 1935

By the early 1940s, Verrier Elwin had emerged as an eloquent spokesman for the tribal communities of the Indian heartland. He had by now realised his own untittedness for social work. Providing education and medical relief was not his line; these were best left to his colleague Shamrao Hivale, who ran on his own the schools and hospital they had set up in Mandla. "The pen is my chief weapon with which I fight for my poor", Elwin had written to an Italian friend in March 1938. He had just completed his book on the Baiga, with its daring and controversial proposals for creating a National Park to protect the tribe from the corruptions of civilisation,34 That work was only the first in a series of rich ethnographies and pamphlets through which Elwin fought for his poor, the voiceless tribals of central India. His mission is best explained in the preface to the most famous of his books, The Muria and their Ghotul. It was A E Housman's ambition, wrote Elwin,

that one day a copy of *The Shropshue Lad* taken into battle should stop a bullet aimed at a soldier's heart. I have a similar desire for this, as for all my other books, that in the battle for existence which the Indian aboriginal now has to wage, it may protect him from some of the deadly shafts of exploitation, interference and repression that civilisation so constantly launches at his heart. If this book does anything to help the Muria to continue as they are today, free and innocent, I shall be content. 35

The Muria themselves were one of the tribes Elwin felt to be in most urgent need of protection. At this time, he divided Indian aboriginals into three broad groupings. The smallest class comprised the tribal clite: aristocrats, lawyers and legislators, who had effectively won the battle of culture-contact, assimilating themselves into civilised life without degradation or loss of dignity. At the other end of the spectrum were the isolated communities, the pure aboriginals who retained the characteristic elements of tribal life - these were the people who knew little of civilisation, and thought little of it. In between these two extremes lay the vast majority of tribals, long subject to the inroads of civilisation yet unequipped to come to terms with it; plagued by economic loss, moral degradation, and psychic despair.

Elwin's position with regard to this last, most numerous class is never very clear: whether to turn the clock back, or allow their fuller assimilation into the dominant culture. At any event, he saw his work as being the protection of the 'real primitive' from the inroads of civilisation. Thus, in the closing pages of The Baiga he proposed the creation of a National Park, where the Barga would have the freedom to hunt, fish and practice bewar, with the entry of non-aboriginals prohibited The term 'National Park' was unfortunate, for it led critics to immediately accuse him of wanting to put the tribe into a zoo, to which the anthropologist, alone among outsiders, would have privileged access. As this criticism has dogged the appreciation of Elwin's work right down to the present, in his own answer is worth taking note of "One of the more foolish things that has been said about us recently", wrote Elwin in March 1942.

is that we want to keep the aboriginal in a zoo. This is particularly ungenerous in our case. For what is the meaning of putting an animal in the Zoo? You take it away from its home, you deprive it of its freedom, and you tob it of its natural diet and normal existence. But my whole life has been devoted to fighting for the freedom of the aboriginals, to restore to them their ancestral jungle and mountain country which is their home and to enable them to live their own lives, to have their own diet, and to refresh themselves with their traditional recreations.

Elwin's plea, then, was for civilisation to allow the aboriginals to live their lives in the way they knew best. This meant providing them security of land, the freedom of the forest, and protection from landlords moneylenders, and subordinate officials. He quotes with relish an Orissa aboriginal who told him "We love our hills, we have always fed on fruit and roots and we don't want to change. We care nothing for hospitals and schools, all we want is our hills" "This was a freedom demed by the British and the Congress, but not by the more sympathetic of Indian princes. The anthropologis, 's model was the chiefdom of Bastar, whose officials were respectful of tribal custom, where forest laws were liberal, and where local selfgovernment (as in the village panchayat system) was firmly in place. For Elwin, the prophylactic and temedial measures taken by the Bastar administration had kept their tribesmen 'a dignified and noble people'." He himself found at "most refreshing to go to Bastar from the reform-stricken and barren districts of the Central Provinces". Everytime he entered the state from British territory, he seemed to hear the whole countryside bursting into song around him 10

Elwin's theory of the state was simple and straightforward: all governments are bad, although some of their officials might be good. It was by keeping out the state, and puritan reformers, that Elwin hoped to protect his beloved aboriginal from the shafts that civilisation continually thrust at him. Here the pen was his chief, perhaps sole weapon; his life with the tribals, his justification. Others, then and now, might question his authority to speak for 20 million Indians. One who acknowledged it fully was his friend and fellow anthropologist, W G Archer. The poem which follows nicely captures Elwin's own contrast between the world of the primitive and the world of the civilised, and his preoccupation with protecting one from the inroads of the other:

For Verrier Elwin by W G Archer Beyond the white fantastic mountains The war is fracturing the foreign cities. The Western style makes toys of the dead And in the little brittle churches. The girls are praying with long hair For the hours of the future and the sexless houses.

Among your burning hills, the lonely jungle Roars in the summer. The sterile land Rests; and news comes up like clouds While you are active in the needs of peace Saving the gestures of the happy lovers The poems vivid as the tiger Faced with destruction from the septic plains And with your love and art delay The crawling agony and the death of the tribes 41

#### VI

Convinced that humanity and variety are synonymous, Elwin has always condemned the busybodies who, be it in the name of religion or at the behest of politics, would impose on primitive innonence the standardised sophistications of modern civilisation, and just as in the old days he aroused the active hostility of many a British official by his open association with the movement for Indian independence, so now his disapproval of cumulative encroachments on the integrity of primitive culture may seem suspect to champions of militant nationalism

Sudhindranath Dutta

Verner Elwin's indictmen', in November 1933, of Indian nationalists for their neglect of the tribes had allowed for one exception: 'the heroic little band of workers associated with the Bhil Seva Mandal'.

The Bhil Seva Mandal was started by Amritlal (A V) Thakkar in 1923. Thakkar, who was born in 1869, two months after Mahatma Gandhi and in the same state of Gujarat, had first been trained as an engineer. In 1914 he left his job in the Bombay municipality to join the Servants of India Society, the social welfare organisation

founded by the great Poona nationalist, Gopal Krishna Gokhale. Here Thakkar worked on various tasks assigned to him by the Society, especially famine relief. An extended tour of western India in 1921-22 brought him face to face with the poverty of Bhil tribals. Soon afterwards, he founded the Bhil Seva Mandal, a welfare organisation run and staffed by Indians. It ran schools and dispensaries for the Bhils, interceded on their behalf with moneylenders and officials, and promoted khadi and temperance.<sup>42</sup>

Mahatma Gandhi, when once asked why he had paid little attention to the tribes, replied: "I have entrusted that part of our work to A V Thakkar". "Universally known as 'Bapa' (Father) Thakkar was undoubtedly a man of great integrity, courage and commitment. Thakkar Bapa, wrote an admirer in 1928, was

a friend of the poor, the untouchable and the aborigine. The cry of torment, anguish and torture attracts him from one remote corner to the other Whether it be a famine calamity or a flood devastation, official persecution or temperance work, khaddar organisation or opening wells and tanks for untouchables, you cannot miss the mark and the guiding and unerring hand of Amritlal. The theatre of his activities is among the depressed and the oppressed in out-of-the-way places or among forest tribes in the hills.<sup>44</sup>

It was Thakkar who was to be the 'first inspirer' of Verrier Elwin's mission to the Gonds. In the beginning, his Gond Seva Mandal followed the Bhil Seva Mandal in its programme of khadi, temperance work and basic education, but over the years the divergences became more apparent. A skepticism of Thakkar's philosophy and a high regard for his person come together in a speech delivered by Elwin at a public meeting in Bombay to mark his mentor's 70th birthday. He first honoured Thakkar as an angel who "attended to everything whether it was a Prime Minister, a hungry child or a broken bridge", but then proceeded, in a more two-edged, ironic mode, to recall

the famous pronouncement of Sam Weller regarding Mr Pickwick that he was a 'regular thoroughbred angel' though he wore breeches and garters. If there could be an angel in breeches, I do not see why there should not be one in a dhoti or a Gandhi cap, though I have no reliable information that the wearing of khaddar had been made compulsory in heaven. It may not be quite proper too, to compare Thakkar Bapa to Mr Pickwick because of the latter's opinion on Prohibition, but they had certain angelic virtues in common, such as being good to people in every way without being pompous and patronising. The only difference between an angel and Thakkar Bapa in this respect was that while an angel flew on wings, Thakkar Bapa did a good deal of his flying in motor buses and third-class carriages.<sup>45</sup>

This was spoken in November 1939. Within the year, Elwin and Thakkar were embroiled in an heated exchange of letters. A private disagreement at first, this was to go public in the columns of *The Times of India*. His affection for Thakkar notwithstanding, 10 years in central India had convinced Elwin that his friend's philosophy, if not his practice, was deeply misguided.

Thakkar's own views are summarised in his R R Kale memorial lecture, delivered in September 1941 at Poona's Gokhale Institute of Politics and Economics. Here he defined two distinctive points of view with regard to the tribes, 'Isolation' and 'Assimilation', that were to gain wide currency. Isolation was characteristic of anthropologists and ICS officials, who wished to keep the aboriginals 'untouched by the civilisation of the plains', fearing that culture-contact would undermine tribal solidarity and expose them to the evils of caste and purdah. Thakkar rejected isolation, hoping instead that a 'healthy comradeship' would develop between tribals and non-tribals. By a policy of assimilation, he wrote

The aborigines should form part of the civilised communities of our country not for the purpose of swelling the figures of the followers of this religion or that, but to share with the advanced communities the privileges and duties on equal terms in the general social and political life of the country Separatism and isolation seem to be dangerous theories and they strike at the root of national solidarity. We have already enough communal troubles, and should we add to them instead of seeing that we are all one and indivisible? Safety lies in union not in isolation. 46

For Elwin, of course, 'assimilation' merely spelt 'degeneration'. On questions of practical policy too he found himself at odds with his one-time mentor. Where Elwin gloried in their joyful attitude to sex, Thakkar upbraided the aboriginals for their "crude mantal relations and promiscuity in sexual matters" (he had been horrified by what he read in The Baiga). Where the anthropologist defended the tribal's love of drink, the reformer wished gradually but firmly to introduce prohibition. And where Elwin wished for protection to be given to shifting cultivation, Thakkar prescribed that the plough everywhere replace swidden, which he condemned as a 'wasteful' form of cultivation which only encouraged the tribal's 'proverbial' laziness.

These differences first surfaced in September 1940, when Elwin received a letter from Thakkar proposing the creation of a non-political, all-India association to be called the 'Indian Aborigines Friends

Society'.47 The provisional aims of the Society were

I To study the living conditions of the members of the Hill and Forest Tribes who live an isolated life, to bring them nearer to their own tribals living in the plains and to be familiar with their customs and manners 2 To organise, co-ordinate and assist welfare work conducted for their benefit, such as schools, dispensaries, sanitation and hygiene, which, it is always understood, is conducted on humanitarian lines only [that is, without a view to religious conversion]

3 To represent to the Provincial Governments concerned their disabilities and to suggest schemes for their moral, cultural, economic and political uplift with a view to bring them on a par with the advanced classes in the community. 48

Elwin welcomed the idea of a countrywide association for aboriginal welfare, yet worried that it might come to be dominated by 'Congress minded Hindus'. He saw a deep divergence of opinion emerging between what he called the Interventionist and Protectionist points of view. Himself an 'out and out Protectionist', Elwin wanted to safeguard the Indian aboriginal from the fate of aboriginal peoples in other parts of the world. For in Africa, Australia, and the Americas, degradation had everywhere followed the rapid contact with civilisation through the collapse of tribal religion and social organisation, the extinction of village industry the weakening of moral fibre, and, very often, extermination itself

The Protectionist was also distinguished by his love and reverence for the aboriginal. He does not regard him as being on a lower level. He recognises that his honesty, his courage, his simplicity, his truthfulness are fair superior to the normal level of honesty and truth in civilised society. He regards as intolerable, the suggestion that he should tuplift, him. He admires his culture and religion and would like to preserve all that has "survival-value".

The Interventionist on the other hand "is all for uplift". "In his heart he looks down on the aboriginal" regarding him "as being on a lower social and cultural level than himself". The Interventionist had strong ideas of what was good for men, applying them universally regardless of cultural differences.

That the two men had sharp differences is clear, although the intensity of Elwin's reply was not unrelated to his mairiage, but six months previously, to a tribal girl quite proud of her own culture—a culture which he saw no reason to change (still less 'uplift') at all. But Elwin was also contesting the belief, pervasive in 19th century anthropology and in 20 century social work, that cultures could be arranged hierarchically, in an evolutionary sequence. In some respects he even tried to invert this hierarchy, in

suggesting that the civilised had much to learn from the primitive. He was thus 'profoundly shocked' by Thakkar's suggestion that the proud, free aboriginal of the hills be brought nearer to the decayed, degraded, Hinduised tribal of the plains.

Elwin went on to suggest an alternate set of six aims for the new association. Three clauses are versions of those drafted by Thakkar - the need to study tribal life, undertake welfare work, and intercede on their behalf with government - but taking care to remove all phrases smacking of 'uplift'. A fourth called for the devising of means of economic progress with the minimum of dislocation and distress. A fifth asked for special protection for the aboriginals from their traditional exploiters "oppressive landlords, grasping moneylenders [and] corrupt officials" - as well as from "ignorant politicians [and] proselytising missionaries of any religion. .' His own preferences were expressed most clearly in the last clause, which asked the association

To do everything possible to revive and encourage all that is good and that has survival value in the traditional tribal culture. This will include the revival of aboriginal village industries, restoration of hunting rights, stimulation of dancing and singing and the worship of ancient gods. 30

Thakkar's reply to this letter is lost. But a few months later, in June 1941, he sent Elwin acopy of a report that he had submitted to the Orissa government on tribal policy Elwin disagreed with most of the recommendations, and focused on what was (from his point of view) the most drastic the curbs on swidden cultivation or bewar His response, once again, was vehement, in a letter written with "my whole life, all my interests, my bones and my blood behind it" For years, he told Thakkar,

I have been striving to get the Imperialist Government to allow a few human rights to the aboriginals. First and foremost among those rights is that of shifting cultivation lust as a certain impression has been created, the fruit of hour after hour of patient and often weary work, you come and cut the ground underneath my feet.

And in whose interests would you stop bewar? The forests belong to the aboriginal I should have thought that anyone who was a Nationalist would at least advocate swaraj for the aboriginal! It is a sad and grievous thing for someone like yourself arguing in favour of taking away from the poor yet another of their treasured tights. I am absolutely convinced that the policy you have set in the Orissa Report will lead to nothing but the degradation, the decay, the demoralisation of these poor people, and children yet unborn will curse your honoured name. So

Thakkar chose not to reply to this 'long sermon'. 31 But echoes of the exchange are visible in his Poona lecture of September, where his categories of 'Isolation' and 'Assimilation' are merely transpositions of 'Protection' and 'Intervention', the categories originally used by Elwin to distinguish their respective positions. The two sets of terms accurately reflect each man's set of values Isolation implies the keeping away of tribals from the modern world and what it had to ofter, Protection a heroic defence of the pure aboriginal from the shafts civilisation continually thrust at him. Likewise, Intervention connotes an aggressive and unwarranted tampering with tribal culture, Assimilation a gentle easing of that culture into the bosom of its mother civilisation

The debate went public in October 1941, when The Times of India carried a unsigned. joint review of Thakkar's Kale lecture and Elwin's recently published pamphlet, Loss of Nerve, a review in which the comparison was all to the anthropologist's favour. Where Thakkar presented his material ex cathedra. wrote the critic, without much supporting evidence, Elwin made practically no statement unsupported by fact. And where the reformer was beset with prejudice against sex, the 'drink evil', and shifting cultivation, the anthropologist countered these illinformed criticisms of tribal life with a body of scientific evidence. Writing in a newspaper owned by Europeans and long hostile to the Indian national inovement, the reviewer could not resist this last, telling crack.

It is peculiar that Mr Elwin, representative of the 'exploiting foreigner', should produce a thesis which is instinct with liberalism against Mr Thakkar's authoritarian nostrums, well-intentioned though the latter undoubtedly are 50

Thakkar had previously been subject to a hostile editorial in the same newspaper, attacked once again, he was moved to respond. In a letter to The Times of India, he drew attention to the different angles of vision from which the tribals were being viewed. Anthropologists like Elwin, he remarked, might even countenance adultery, witchcraft, human sacrifice - in the belief that the 'original culture' of the tribals should not be "tainted by the so-called alien culture of the Indian nationalists". Other Indians wished to copy the 'good customs' of the tribals (truthfulness and simplicity of life) while at the same time "educating the aboriginals to the level of the rest of the population". But the anthropologists "evidently desire to keep them isolated and untouched by civilisation, as if they are ashamed of their [own] civilisation".53

Replying from his field station in Bastar, Elwin would not accept that there was any conflict between his science and nationalism Indeed. "since the anthropologist is

concerned to record many phases of national ulture and to reveal it in its true synthesis and beauty any intelligent national movement will use him to the full". Alongside this defence of anthropology went a defence of aboriginal life that was (as Thakkar had noted) proof of Elwin's misgivings about civilisation. The 'real problem' in his view was "not the possible defects of primitive culture, but the very obvious defects of our own". The Congress would be making a profound mistake' if it were to disregard the warnings of anthropology and follow a reactionary policy of oppression and interference' in tribal areas. If it did, there might even be rebellion and bloodshed. Elwin claimed that the Konds of Orissa, bearing the burden of Thakkar's report, had "threatened to offer a human sacrifice to the 'New God Gandhi' so that they will not be deprived of any more of their elementary human rights" 11

In his final letter to The Times of India. Elwin wrote of his reluctance "to continue any controversy with my old and honoured friend, Mr A V Thakkar". By now the debate had acquired a momentum of its own, to be carried on by other people in other forums Evelyn Wood, a Bombay businessman and friend of Elwin's, wrote a sharp and personal attack on Thakkar, accusing him of 'misinformation', 'infinite condescension', and of being isolated by "a retinue of chelas from the people among whom, no doubt, he used to work in close contact" 55 A more considered intervention, this time from the side of social reform, appeared in the January 1942 number of the Social Service Quarterly. a Bombay journal linked to the Servants of India Society This charged Elwin of hiding behind the cloak of science. Thus his defence of drink, as a tonic and relaxation to the aboriginal's otherwise comfortless existence, was characterised as "neither science nor common sense, but sheer poetry". More generally, Thakkar was described as a 'hard' headed practical social reformer', Elwin as one who was "simply sentimental and sees the primitive culture and life of the aboriginal with a poet's eye and imagination".56

This was intended (at least in part) as a compliment. Replying in turn, Elwin acknowledged the work for aboriginal welfare of the Servants of India Society With that kind of disinterested work, the aboriginal could indeed be assimilated without loss of livelihood or self-esteem Sadly, for the most part culture-contact was a process over which the aboriginal had little control. Elwin went on to compare, under 18 heads, the condition of the 'isolated' aboriginal with the 'assimilated' one This was an elaboration of his familiar contrast between the pure and decayed tribal, in which the former was found superior in every respect: with regard to his truthfulness. independence, community spirit, morality, treatment of women, and so on 57

Here were two quite distinct angles of vision regarding the tribes. The vulnerability of Elwin's own position, its moral force and basis in experience notwithstanding, was underscored in some comments on the exchange by the social worker and nationalist. P Kodanda Rao, Rao acknowledged Elwin's 'unrivalled knowledge' of tribal life, his deep devotion to their cause. Nonetheless, he charged that the Englishman was "more than a descriptive anthropologist, he is a politician with a policy to propound and propagate" - indeed, his proposals amounted to nothing less than the creation of an 'Aboriginalisthan', a special protectorate to be ruled by anthropologists like limself 38 The reference was chillingly clear. With the Pakistan movement for the partition of India gaining ground, Elwin was being accused of hastening the further division of India on communal lines

#### VII

The universalism of the assimilator is generally a thinly dispuised ethnocentricism

— Tzyetan Todorov

In 1942, his arguments with Elwin just concluded, A V Thakkar was visited by a young anthropologist from Bombay University. The scholar had finished a dissertation on the blafs, and wished to work with Thakkar. The old man, by now heartily sick of anthropologists, told him. "You can join me if you drop your science. I don't want science but humanism and morality."

Science had been Elwin's trump card in his exchange with Thakkar and his ilk it also provided the underpinning of his tract The Aboriginals, published in July 1943, which presented protection as the 'scientific' solution to the tribal situation in Two months later was published The Aborigmes Called and their Future, a scholarly, 240page book by the foremost Indian sociologist G S Ghurye of Bombay University Elwin is the often named and sometimes unnamed antagonist of this work. Ghurye's title was very likely a riposte to the recently printed The Aboriginals, although his critique is directed primarily at The Baiga and Loss of Nerve, the two studies of which that pamphlet was a distillation. A masterful blend of learning and polemic, Ghurve's attack was to mark Elwin for life

Churye's background and orientation were very different from Flwin's. Born in 1893, a saraswat brahmin from the west coast of Maharashtra, he was first trained as a Sanskritist, earning a gold medal in his M. A. He then came under the influence of Patrick Geddes, the great Scotch educationist, baologist and town planner, who was at the time holding a chair in sociology at the

University of Bombay With Geddes' encouragement Ghurye was awarded a scholarship to England, where he earned a Ph D in social anthropology at Cambridge. On his return he joined Bombay University's department of sociology, a department he presided over with stern authority for more than 30 years <sup>61</sup>

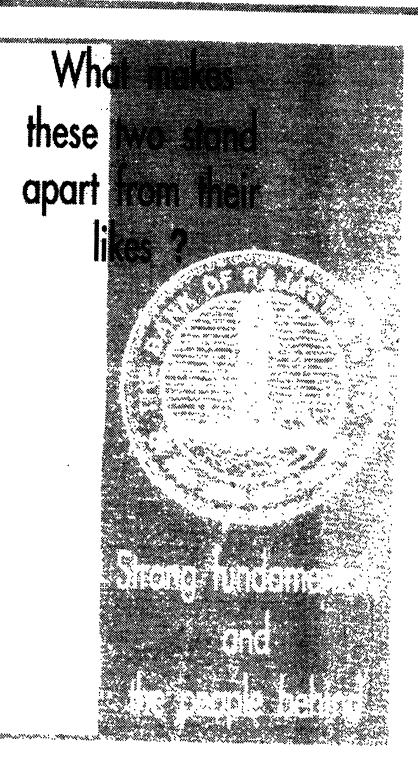

Where Elwin's writings diew abundantly on his life among the tribals, Ghurye abhoried fieldwork, hardly ever leaving Bombay. But he was a formidable textual scholar, with a capacity to synthesise materials collected by other writers. He was also an able polemicist, with a lawyer's skill in systematically and telentlessly arguing his case.

The arguments of *The Aborigines So Called and their Future* are developed in three, closely related stages. Ghurye first demonstrated that, strictly speaking, the aboriginals are not aboriginals at all. For Elwin it was an article of faith that his tribals were autochtones. *The Aboriginals* concluded with these words.

The aborteinals are the real swadeshifproducts of India, in whose presence everyone is foreign. These are the ancient people with moral claims and rights thousands of years old. They were here first they should come first in our regard.<sup>67</sup>

This was at the time an uncontroversial position even A V Thakkar accepted the tribals as the 'original sons' of the soil, 'older and more ancient' than the Hindus. But in Ghurye sopinion "to adjust the claims of the different strata of the Indian society on the ground of the antiquity or comparative modernity of their settlement [was] a formidably difficult task". For Indian history had been characterised by a great deal of internal migration within the subcontinent Many tribal groups had come to their present habitat from elsewhere for instance, the Paharia of Bihar very likely came originally from Karnataka, the Konds of Orissa from the Tamil country and could not properly be called the "original owners of the soil" Chattisgarh, the home of the Gonds had itself been dominated by Hinduism before the emergence of the great Gond kingdom in the medieval period. Nor could the arbes as a whole be regarded as the autochtones of India, for studies on the peopling of the subcontinent suggested that the speakers of Dravidian and Kherwari tongues (who included numerous tribal groups) were an immigrant people as much as the Indo-Arvans "

If tribals were not autochtones, argued Ghurye they were not so culturally distinct either. He demonstrated, through a range of examples, the adoption of Hindu customs by tribal groups, and the close parallels between Hindu religion and belief systems that colonial census officials had erroneously classified as "Animist". Thus tribals widely

The octologist concluded that the "only proper escription of these people" is that they are he imperfectly integrated classes of Hindu ociety". Hence his own preference for the rm 'backward Hindu' instead of 'aborigine' i 'aboriginal'.64

Ghurye next looked at the process of inture-contact, which, again, he viewed quite ifferently from Elwin. He accepted that ibal encounters with Hindus sometimes led distress, but disputed the claim that conomic loss was followed by p vehic espair, an alleged 'loss of nerve. At the ime time, contact with Hindus might also enefit the tribals; by exposing them to etter methods of cultivation, or curing them t drunkenness. Noting that "everything avouring of the Hindu upsets Elwin", thurve disposed of the four reasons why Jwin wished to restrict Hindu influence on ibal life - namely, that it would mean the cceptance of the status of untouchables, a wering in the position of women, the stroduction of child marriage, and the ippression of their song and dance. For the evalent mood was one of equality popular ovements among Hindus themselves, rainst untouchabitity and for the nancipation of women, would not nuntenance tribal entry at the bottom of the iste hierarchy or the exploitation of their omen. Likewise, the growing interest in 4k culture and folk dance might even work protect at least some aspects of tribal song ad dance, which would come to form part "the total complex which is arising called dian culture". On the question of child arriage, Ghurye was not convinced that it ould be harmfu! in the tribal context, on e contrary, it might temper their sexual ence, check the spread of venereal disease. id enhance marital stability.

In Ghurye's view, British imperial rule as the larger, so to speak structural cause tribal discontent. For it was the intoads the British system of law and revenue that id, in the first place, created the conditions if the crossion of tribal solidarity. The tablishment of individual property rights land, the creation of a land market, stringent rest laws, and an exploitative excise policy id all worked to impoverish the tribals. Ishing them into the clutches of landlords, oneylenders and liquor contractors. As the conomist, D. R. Gadgil (like Ghurye, a ambridge man but passionate nationalist)

noted in a perceptive foreword to the book. Hindu exploitation of tribals was a secondary phenomenon, enabled precisely by the primary phenomenon of British dominion. It was the establishment and consolidation of British rule that had "brought about a revolution in the nature and extent of the contact with the aborigine". The problem of tribal poverty was inseparable from the larger history of colonial exploitation, a connection which had escaped Isolationists like Elwin "

In a sustained critique of the National Park idea. Ghurye dismissed Elwin as a 'nochanger' and 'revivalist', one who wished to see "the aborigines' reinstated in their old tribal ways irrespective of any other consideration" in Ghurye's own values emerge at various points in his book. He had a strong aversion to drink, which he saw as acurse on tribal life—leading to insteadiness, dissipation of energy and indolence—as well as a distaste for pre-marital sex. Ghurye was both a puritan and an 'improver', whose interpretation of tribe-Hindurelations flowed logically into an enthusiasm for reform

Ghurye's polemic was extended by his pupil M N Srinivas in a review of The Aboriginals, Elwin's invocation of 'loss of nerve' was dismissed by the young scholar as a 'conveniently vague expression', a misleading application in the Indian context of the idea of a loss of interest in life, which the anthropologist W. H. R. Rivers had developed in Melanesia - where it had a solid and verifiable basis in depopulation. disease and starvation. String a slice exposed Elwin's claim that the policy of protection was based on the authority of science. To the argument that the importation of plough cultivation would prove fatal to the bewarfoving Baiga, Srinivas responded "Edwin here forgets a fact which every tyro in Anthropology knows cultures are never static, but dynamic. Old traits are thrown off or modified and new ones adopted. And that is life. Of course a certain immigrant trait may be disastrous to the group. But that has to be proved in every case. There is nothing to prove that the Baigas are incapable of taking to [plough] agriculture. We may have to do it with special caution and slowness. but that is quite different from maintaining that it can't be done at all" "

In an interview with this writer, M N Srinivas recalled that he was specifically asked by his teacher to take on *Thi Aboriginals* (a best-selling pamphlet which appeared too late for Ghurye to take account of in his own book). There is little question that Ghurye had a deep animus against Elwin He was jealous of Elwin's popularity and, as a puritan, deeply disapproving of his personal life (or what he imagined it to be). Ghurye never forgave one of his students, Durga Bhagwat, for taking Elwin's advice before doing fieldwork with the Gonds. When

he found himself in the same room as Elwin, in a seminar at the Asiatic Society, he turned to a friend and whispered "Do you see his face" He has the mouth of a sexual pervert" \*\*

Were this a scholarly debate conducted in (say) 1920 in the pages of a journal of anthropology, Elwin might well have shrugged it off as a dispute between Oxford and Cambridge, the Protectionist and the Interventionist, the Aesthete and the Puritan, the Fieldworker and the Library Worm, But this was India in 1943, a nation on the eveof independence, struggling to come to terms with the problems of its vast and diverse population. This was a time of rising patriotism, but also of a growing confusion and division within the ranks of a once united national movement. The claims of the Congress to represent all of India were being strongly challenged by the Muslim League. which accused it of being a party of the Hindus and a little less successfully by untouchables and socialists, who charged it with representing the interests of upper castes and capitalists. The thesis of tribal autonomy and distinctiveness put forward by Flwin appeared, in the circumstances, to be yet another blow to the unity of a nation in the making. Faced with the prospect of Pakistan and growing tension within Hindu society the national movement could ill afford the merest thought, let alone the creation, of an 'Aboriginalisthan' Like Mohammad Ali Inniah of the Muslims and B.R. Ambedkar of the untouchables, Elwin was being cast as a 'betrayer' of the cause of a greater, united India

It was here that Ghurye's attack was at its most telling. With A. V. Thakkar, the Bombay sociologist spoke in the name of a) intary stream of nationalism, while Edwin appeared to be on the other side of the fence. politically speaking, forcing wide open through his work the cracks in the Indian social fabric. The sociologist also pointed to the convergence between the views of Elwin and the work of ICS officials with a special interest in the tribes. Lar more effectively than in Thakkar's Kale lecture. "Isolation" was identified as a quintessentially English, even colonial project. And these criticisms came from the pen of a highly regarded scholar, not a social worker whom Elwin could dismiss as being unfamiliar with the methodology and findings of 'science'

Elwin most keenly felt the force of Ghurye's attack Two comments inhis friend Shamrao Hivale's book Scholar Gypsy are revealing One refers to a "very unfair book" by a "Bombay scholar", the other, identifying the scholar by name, talks of Elwin's admiration for Ghurye's intellect and power of stimulating research in his pupils, but continues—"unhappily he lacks the social gifts" <sup>66</sup> But it was in a letter to W.G. Archer

mai ne most runy revealed ms reemigs. Ghurye's book, he told his friend, was an "odious book written by [an] anthropological Quisling": were it not refuted, it might do "incalculable harm to the aboriginals and to our whole cause". He wanted to set aside an issue of the journal Man in India (which the two of them then edited) to "putting Ghurye in his place", with reviews of The Aborigines So Called and their Future commissioned from W V Grigson of the ICS, the Austrian expert on the tribes, C von Furer Harmendorf, and the Indian anthropologist B S Guha all men likely to come down on Elwin's side. On Archer's advice, though, Man in India took the more prudent and politic course of simply ignoring the book.10

#### VIII

It is well known that Mr Verrier Elwin has a bee in his bonnet. The bee gives the wax of anthropology with the honey of romance and it has a sting which is specially reserved for Missionaries. The wax and the honey are welcome, but all fair-minded people must object to the sting, particularly when it turns venomous.

Father F Correia-Afonso, S J. July 1944

The debate with Thakkar had pitted one style of social work with another: Ghurye's attack, one style of anthropology versus another. In a third controversy Elwin, a lapsed Christian priest himself, took on a group of Dutch Catholics who still zealously pursued their faith

Elwin's hostility to the Dutch priests was an indication of how far his identification with the tribals had distanced him from Christianity He had of course been opposed from the first to conversion work. In 1933, soon after he moved to Mandla, CF Andrews admonished him for not proselytising the Gonds, to thus help free the primitive mind from fear and superstition. Four years later, by which time Elwin had left the Church of England, he was invited by the World Missionary Conference to contribute an essay on aboriginal tribes, with special reference to 'the menace of Hinduism'. In a sharp response, Elwin pointed out that "there can be little doubt that Christian civilisation is more destructive to primitive tribal life and morals than any other form of culture" "

In 1940, just before he left for Bastar, Elwin had a brief and indirect skirmish with the Catholics. W V Grigson, then writing a report on aboriginals for the Central Provinces government, asked Dutch priests working in Mandla for their opinion of Gond culture. Their teply combined a concern with gond poverty with a low opinion of their morality. The priests were especially worried by the looseness of the marriage tree.

among the iviandia tribais, the freedom wan which the Gond woman could change partners. They wanted the government to pass a law which would provide. "(a) an easy and inexpensive way of restitution of conjugal rights, both for men and women; (b) quick punishment of the man a married woman runs away to". The priests claimed that the love of the Gond for the 'karma' dance was instrumental in the break-up of tribal marriages. For the missionaries, the first reason why women deserted their husbands was "the excessive sexual excitement caused by frequent singing and dancing of karma with its obscene songs and drink throughout the night".72

Edwin, married to an accomplished gond dancer himself, was to react sharply to these judgments. He defended the karma dance as being a marker of the high social status of the gond woman. The torbidding of the dance, in his view, might actually lead to more rather than less adultery, for it would make life intolerably dull for the woman. Karma was "the sole surviving instrument of gond culture, it is a symbol of the freedom and independence of the gond woman; it is a source of a living art and poetry, in Mandla especially its tunes and rhythms are some of the most beautiful in India". He urged Grigson to be "very cautious about publishing missionary allegations against the morals of the aboriginals", which, if made public, would lead to "considerable and very proper indignation among educated Gonds of this wholesale and partly false indictment of their community".13

The argument resumed when Elwin returned from Bastar late in 1943, after spending close to three years in that chiefdom While he was away, the Catholics had been making steady progress among the Gonds There were now 35 Dutch priests in the district, working with a large body of Christian clerks and teachers brought from Ranchi in Bihar, an old centre of missionary work among tribals. Their activities expanded enormously in the war years, helped by massive, if covert, government funding. To his horror, Elwin counted more than 100 schools run by the Catholics, schools that bore "little resemblance to educational institutions" but were "simply centres of proselytisation".21

In a polemic circulated for support early in 1944, Etwin criticised missionary work on three counts. First, it was an anachronism: no one could believe any longer that salvation was to be found only in the Catholic Church, an institution that had fathered the Inquistion and had a long history of supporting dictators. Free countries did not permit their populations to be proselytised, and India, on the verge of its own independence, was not a 'savage' or 'heathen' country but had religious traditions far older than Catholic

Europe. The aboriginals of mula themselves had "their own life, their own art and culture [and] their own religion, to which they are deeply attached and which is by no means to be despised".

All over the world, wrote Elwin, conversion of tribals by missionaries had undermined traditional political institutions, intensified personal rivalries, and implanted a false sense of prudery and sin. The change of religion, in India as in Africa or Melanesia, "destroys tribal unity, strips the people of age-old moral sanctions, separates them from the mass of their fellow-countrymen and in many cases leads to a decadence that is as pathetic as it is deplorable"

Moreover, the methods used by missionaries in Mandla were quite unacceptable. These included the exploitation of aboriginal poverty and of the great wealth of the Catholic church to bribe tribals into being baptised; the terrorising of Gonds and Baigas through threats, abuse and beatings, and the use of the prestige of the dominant race and of state power in support of their activities — for instance, by interfering in court cases and fostering the belief that their schools were government schools.

As ever, Elwin resorted to his favourite trope—the analogy across cultures—to drive home the point—Suppose, he wrote,

a Hindu mission went to England, spread itself over the peaceful villages of Cornwall, threatened the people with prosecution and beating it they did not attend temples, interfered in the civil and criminal cases before the courts, indulged in vicious propaganda against the local Christian leaders—for how long would the British Government perint them to remain? But today in Mandla this is exactly what is happening, not only with the compliance but with the active support of the authorities?

Elwin's most effective attack on the Catholics was an essay which appeared in the *Hindustan Times*—on June 14, 1944. Both the timing—months after Ghurye had midded him—and the place of publication—the foremost nationalist newspaper—are significant. So too is the imagery, an uninistakably Hindu one. The priests in Mandla, claimed Elwin

are the Chindits of the Christian Aimy Compared to them, most other missionaries get to work like Italian infantiymen. These Fathers are from Holland. Fortified by the philosophia petennis, inspired not only by a divine love of souls but by the remarkable. Dutch instinct for colonial expansion, they are busy turning. Mandla into a Dutch colony. Within 10 years Mandla in the ancient home of the Rishis, former kingdom of the Gonds, whose fields are blessed by the sacred Narmada in will be virtually a Dutch colony with a hundred thousand Catholic converts. The

Three weeks later, Elwin sent in an update on the situation in 'the occupied territory of

Mandla', with more evidence of conversion through coercion and bribery. His , omparisons were characteristically focused and most carefully chosen. The priests, he reported, had given the tribals medals to kiss morning and evening. On one side of each medal was embossed the image of the Queen of Heaven, on the other "the unprepossessing features of the Italian potentate who blessed Badoglio's armies on their way to the rape of Abysinnia. It was not indeed, a bad symbol for the conquest of Mandla - for the aboriginals and Hindus of the district are as simple and as defenceless against foreign aggression as were the ill-armed Abysinnians"."

Elwin's attack brought forth a wideranging response from his adversaries. In three separate replies in the Hindustan Times, the priests acknowledged their intention of making converts, but denied any coercion 78 A well-attended meeting, held at the Catholic Institute in Nagpur, recorded the protest of the Christians of the Central Provinces at Elwin's challenge to "the inherent and tundamental Christian right of absolute treedom to propagate the Gospel of Christ in any part of India". One speaker warned "Hindu friends that any move to restrict freedom to propagate religion would come back on them like a boomerang" 19 was mere bravado. The Dutch Catholics canvassed far and wide, but the tide was against them. A tribal convert from Ranchi published a rejoinder to Elwin, which seems to have tallen still-born from the press \*0 The priests even made contact with Leo Amery, the secretary of state for India, arch Christian and arch imperialist, asking him to deport Elwin to Britain Amery wrote hopefully to Lord Wavell, the viceroy, who answered that to interfere in the 'unedifying dispute' between Elwin and the priests would only "arouse suspicion both between the various communities and against the British" kt

Meanwhile, Elwin had also been seeking help. By his own admission, he had been out of touch with the 'Gandhi-people' for years, but with the transfer of power at hand, they now appeared as his natural allies in "the deliverance of the aboriginal from political, religious and economic exploitation ... Among those whose support he sought were the industrialist, Purshottamdas Thakurdas, the veteran Congress leader Bhuiabhai Desai, and his old mentor and more recent adversary. A V Thakkar. After visiting Mandla in March 1944, Thakkar deputed his associate P G Vannikar to organise a Gond Sevak Mandal in co-operation with Shamrao and Verrier They were soon joined by a Hindu service organisation, the Arya Dharma Seva Sangh. In a short while, the three groups were able to close down 25 mission schools. By the end of 1946, Elwin could report with satisfaction that the advance of the Dutch missionaries in Mandla "had been halted and their work greatly constricted".<sup>82</sup>

The struggle with the missionaries thus allowed Elwin to patch up with Thakkar and beyond that, to reaffirm his Indian identity, an identity that had sharply been called into question by Hindu social workers and by sociologists. Elwin was in principle opposed to both Catholic priests and 'Congress minded Hindus', but asked (or forced) to choose, there was little doubt which side he would come down on. For one thing, he saw the Congress as a slightly less intrusive force, he acknowledged aboriginal religion to have some affinity with Hinduism, none at all with Christianity. For another, he was keenly aware of their rising influence with the coming of Indian independence

Elwin's moves were tactical and opportunistic, but not in a narrowly personal sense. By allying with the nationalists, he thought he might more effectively protect his tribals. The aim of the movement against the missionaries, he wrote, "is to awaken the Hindu community to its duty towards the aboriginal." He thus urged "on all Hindu organisations interested in this problem to pass resolutions accepting the major aboriginal communities as Kshatriyas which is what they are and what they claim to be, to stop talking of them as 'backward' and 'depressed' [and] to drop the horrible word 'uplift' from their vocabulary." 83

#### IX

The three controversies I write of here were all omitted from Verrier Elwin's autobiography, a book, published in 1964, in which the author would not allow old arguments to disturb the smooth recounting of a life spent in and for India. "In the story of my life", he was to write, "I have deliberately played down its difficulties." The arguments of the 1940s are dismissed in this solitary sentence. "A lot of people were down on me in those days and, for an ordinary person, I had a rather disproportionate volume of notice in the press, some of it extravagantly kind, some bitterly hostile". "

An autobiography is to be studied both for what it contains and for what it leaves out; thus Elwin's silence might be linked to his desire, as an Englishman in newly independent India, to distance himself from a past that had at times called into question his fidelity to his adopted land. For the patriotism promoted by the ruling Congress would not easily allow partisan stances on behalf of any one segment of the nation; while calls for mobilisation according to class and (at a pinch) language were grudgingly tolerated, the claims of caste.

religion and ethnicity were reckoned as spurious and illegitimate. Through the 1950s and 1960s, ideologists of dalit resurgence and Hindu militancy were on the retreat; so, by the same token, were detenders of the aboriginals. Ambedkin had been assimilated into the government of India (his last defiant gesture towards Buddhism being regarded, at the time, as symbolic tather than substantial). Jaipal Singh had joined the Congress, the RSS had been driven underground, its ideology finding few takers.

In an atmosphere suffused by a unified and unitary nationalism. Elwin was further constrained by his official position, for between 1954 and 1964 he was the adviser on tribal affairs to the north-east frontier agency. Prudence now demanded a more carefully guarded advocacy of tribal rights. Deeply marked by the fights of the 1940s. Elwin was in his later work to reject the two extremes of 'Protection' and 'Intervention' in favour of the middle way of 'Integration', defined as a process whereby tribals would not be submerged but integrated with full, honour and respect into the new nation Even this cautiously euphemistic formulation was attacked as divisive of national unity. added reason for Edwin to banish the battles of the 1940s from the pages of his autobiography 85

Sofaras I cantell, the only printed reference to those old, debates occurs in an essay written for the Delhi journal, Seminor—In 1959, G. S. Ghurye brought out a revised edition of his book, which retained almost all the original (and derisive) references to Elwin, but without once referring to his writings in the interim. Elwin now accused the Bombay scholar of "flogging a dead horse". By this he meant that the times had changed, and he with them, Elwin went on to refer. Ghurye to his espousal of 'Integration as an effective and acceptable alternative to the old polarities they had once disagreed upon. 86

Thirty-five years later, in a political (and intellectual) climate that is radically altered. one might think that the horse is not so dead after all. When the claims of unitary nationalism are being as sailed from all sides, when sectarian identities of dalits, backward castes and Hindus are being aggressively crafted, the tribal question is once again emerging in its most starkly polarised form. For the encounter between tribals and the outside world is yet conducted on grossly unequal terms, the loss of land and forests being joined by the loss of the adivasi's living space, as tribals come to form a very large proportion of the millions displaced by steel mills, coal mines, and dams. In cultural terms, movements that assert tribal autonomy and distinctiveness (as in the reinvigorated Jharkhand movement) have been met by counter-movements, helped along by the Sangh parivar, which hope to more fully assimilate tribals into the Hindu way of life. Meanwhile, competing valuations of adivasi culture, as well as bitter conflicts over resource access, have been vividly brought to the surface by the long struggle over the building of the Sardar Sarovar dam.\*

The Elwin-Ghurye, Elwin-Thakkar, and Elwin-Missionary arguments might constitute a largely forgotten chapter in the intellectual history of modern India, but their echoes are still being heard. Consider, last of all, the report of the Bhuria Committee. the most recent and in some ways the most authoritative statement of the renewed movements for tribal self-rule. Tribal societies, suggests the report, "have been practising democracies, having been characterised by [an] egalitarian spirit" this "communitarian and co-operative spirit visible in many undertakings like shifting cultivation [and] house construction". And again. "Tribal life and economy in the not too distant past bore a harmonious relationship with nature and its endowment. It was an example of sustainable development. But with the influx of outside population it suffered grievous blows". To reverse this process the committee recommends that "tribal communities should be respected as in command of the economic resources", with gram sabhas placed in charge of land. forests, and minerals, with larger tribal regions given 'sub-state' status, and with "traditional tribal conventions and laws [to] continue to hold validity".\*\*

In its understanding of what tribals are, in its identification of their main enemies, in the solutions it offers for their protection, the Bhuria Committee follows the trail laid down by Verrier Elwin in his writings of the 1930s and 1940s. Some may see this as an unconscious echo, others (in my view more accurately) as a revival and reaffirmation of a strand of adversarial thought suppressed by the world-view dominant during the first-decades of Indian independence. For, as the poet Wallace Stegner once pointed out,

The tracing of ideas is a guessing game. We can't tell who first had an idea; we can only tell who first had it influentially, who formulated it in some form, poemor equation or picture, that others could stumble upon with the shock of recognition 30

In this game, the tracing of the intellectual origins of the popular movements of contemporary India, Verrier Elwin would be placed alongside Jotiba Phule and B R Ambedkar (two other defenders of the rights of subordinated peoples) as the man who first articulated – influentially – the idea that tribals might not be wholly or fairly represented in the (once) hegemonic ideology of Indian nationalism.

#### Notes

The Agro-Climatic Regional Planning Project (ACRP) of the Planning Commission was initiated with a view to provide technical and scientific inputs for the Agriculture & Allied sectors during the VIII plan. The ACRP recognize in an explicit manner the nature of the local resource endownments and constraints of the agro-climatically homogenous regions, which in most cases cut across the states

#### There's only one bank you can rely on. 24 hours a day.

It is at times like this that you wish your bank was accessible 24 hours a day, from any part of the country, and from around the globe. That's why you need 24-Hour Banking from Citibank. You can stop payment on cheques over the phone round the clock, round-the-world. Get a statement

of account. Over the phone. Over the fax. In fact, you can do all your banking over the phone, by speaking to your CitiPhone Officer. Anytime of the day or night convenient to you. From overseas, at no cost at all through the unique "Phone Home" service, or from anywhere in India. That's the power of 24-Hour Banking, Anytime, Anywhere.

Suddenly emergencies are not so daunting. Because The Citi Never Sleeps.

#### Here is what you get. Round-the-clock.

Carl cash

Upto Rs 15(0)) With an automatic account balance. Across all ATMs. Across cities

#### Cort an account atalement

Over the phone.
Through a fac back tankty
Use the Phone Hone Serves
to call you Culfform Officer
it no create all when you are
troubling melecals.

#### fransfer funds

Unal a draft and have it delivered to you within 24 hours

propert from misserings

Open no account

Instantly (Deer the phone lide touris moved automatically to a deposit earning higher rename.

Withdraw from your di post automatically at the ATM

#### Use ather services

Give standing instructions for routine payments (L.P., phone or cheline payments). Settoni bors etc). Cheque bank, credit inpenience, administrative profit circl, particles statement.

Supramon.

available on request

.. in fact do all your hanking 24 hours a day.

#### The Politics of Ecology

#### The Debate on Wildlife and People in India, 1970-95

#### Mahesh Rangarajan

If the older preservationist agenda looks like it is in deep trouble, it still has a lot of life left in it. The preservationists' shortcoming was their reliance on the state machinery, in particular on the legislative and executive power of the union government. But neither a technocracy or bureaucracy acting as the arbiter of conflicts nor a free market system which may tilt towards privatisation of open access resources would address ecological issues adequately, whereas the assertion of people's rights has the potential for a different kind of conservation-oriented control of their lives and lands. The question then becomes one of working out a new set of relations with the forest which will be enduring both for the people and the natural world. How this will be done at a time of demographic growth and agrarian intensification will be a major challenge and site-specific approaches will play a vital role

#### Introduction

IN 1979, in a lecture delivered in Delhi, the naturalist M Krishnan referred to the choice before the conservation movement in India as one between Vedanthangal and Asoka.1 The metaphors used require some explanation. Vedanthangal (Tamil for hunter's tank, a misnomer if there ever was one) is a bird sanctuary near the city of Madras where oral tradition has it that nesting water birds have been protected for nearly two millennia. When British soldiers shot at the storks in 1798, the residents marched off in protest to the collector, who issued a proclamation that no one would be allowed to harm the birds again. Krishnan acknowledged the efficacy of such conservation attempts growing out of religious custom or tradition but then turned to another precedent. The emperor Asoka in the third century BC had in his pillar edicts decreed certain animals and birds as protected. There was also evidence in the Arthashastra that reserves known as Abharanyay had been set aside especially to safeguard elephants. The historicity of these references need not concern us here as much as the conclusion drawn from history. The past was invoked to suggest a strategy for the future. There was a choice between local efforts from the grass roots and state-sponsored schemes from above. One was founded on voluntary participation and the other on the coercive ability of the government. Krishnan warned that there was no time to try the Vedanthangal way. The pressures of demographic and economic expansion left no option but relying on state machinery to save India's wildlife from certain extinction. If there was a tradition to be followed, it was the Asokan one. Krishnan had served in several fora, the advisory body known as the Indian Board for Wildlife set up in 1952 and on the steering committee for Project Tiger. Launched in 1973, the latter was at the time the world's largest single wildlife conservation programme. The basic philosophy of the project was identical to the one championed by Krishnan in his lecture and in his other writings. It was essential to set aside some land, preferably 5 per cent to be preserved 'free of all human activities' (except for protection).2 A country could be lost otherwise than by invasion or conquest, by 'dissipation of its entity from within', and for its own cultural biological identity, it was essential for an India of the future to retain representative patches of fauna and flora in their original state. While the precise quantum of the area to be set aside was specified differently at various times, the nub of the argument was clear \(^1\) Total environmental preservation in a few selected areas was central to a strategy for conservation. It is also important that the key instrument of change was to be the union government. State governments were seen as hostages to special interests that would prevent any long-term programme from getting off the ground. It necessary, additional areas could, it was suggested, even be leased by the centre for 99 years and administered for posterity.4

Krishnan's observations seem especially striking if we examine the present debate about the fate of the protected areas. These wildlife sanctuaries and national parks now cover 4.3 per cent of the land area of India while their core areas constitute about 1 per cent of the land mass.5 While their number and area have expanded considerably, there is little disagreement on one basic point. they are in peril. Encroachment by various industrial and commercial interests on their borders and even within their precincts is not new but it has grown rapidly since 1991. In the new climate of liberalisation, sanctuaries have been de-notified to facilitate the location of extractive industry (mining). tourist resorts, manufacturing plants and other development projects.6 Secondly, in several areas, the administration of protected areas is under attack from local residents living either within or on the perimeter of parks. They point to the double standards that deny them access for livelihood needs while allowing commercial forestry and other allied activities 7 The line taken by Krishnan is still very much the core of official policy In contrast with the significant, if limited, steps in direction of joint forest management, the appeals for participatory or joint management of protected areas have made little headway. This is so despite the fact that the number of people living in and around the latter is now provisionally estimated at 4.5 million and removal of all such populations or closure of all access is neither administratively nor politically feasible 8 The rights of the future generations and of non-human inhabitants of the planet are seen by wildlifers as being under threat from pressing human demands of the present day.9 In contrast to the 1970s, some proservationists are willing to invest in ecologically sound development around the sanctuaries in return for further curbs on resource use within the tracts 10 In common with their predecessors, they see the continued survival of such areas in their natural state as an insurance and an investment in terms of protecting potentially useful species. The moral and ethical aspects are stressed equally forcefully 11 The implication of all this is to retain intact the present structure of bureaucratic control of protected areas under the forest department. This congruence of interests, of ideologically charged notions of preservation and the specific interests of the foresters is striking 12

At the same time, the once-unified ranks of middle class groups are now divided. There is discord even on central issues such as the mechanisms and aims of wildlife conservation. Who is to conserve what and for whom? The wildlife movement has been seen as having two distinct levels, one with a middle class constituency and another in tural centres. This is really a re-working of Krishnan's classification, though the sympa-

thies of analysis are now in a reverse order... While useful, the two-way split between wilderness preservationists and 'popular conservation' misses out on the several shades of grey that he between such extremes. Even in a limited sense, it cannot account for several consequences of the preservationist projects that transcend the specific aims of their proponents. Even supporters of statist projects could be active proponents of voluntary village-level efforts, even if in a very limited way.14 Further, the specific interests of wildlife enthusiasts should not blind us to the wider issues of ecologically sound development or of humankind's ethical responsibility to nature that they put on the agenda.

Secondly, I will try to show how even a narrow and limited social group can, over time, generate fresh initiatives and ideas that break up old alliances. Analysts have often written wildlife enthusiasts off as flamingo-lovers and fans of tiger cubs. Guha is appreciative of how they extend the concept of equity from across classes and nations to other species and generations.15 The question of how to actualise this vision has given rise to new sensibilities that try to take account of the human dimensions of the wildlife question. Even key actors in the drama have changed their views and their constituencies.16 These ideological debates cannot be divorced from the wider context of the environmental questions in India today and their linkage not only with the ecological problem but with the political and social order that may be conducive to addressing it. A brief look at the preservation agendais necessary

#### PRESERVATION: FROM ASCENDANCY TO CRISIS

The India of the early 1950s had important continuities in the attitudes and lifestyles of the elite. Hunting continued to be both a privilege and a pastime for officials, princes and the landed classes as it had earlier in the century. In the Madras presidency, S K Chettur joined the rulei of Venkatagiri in hunting sloth bears from specially constructed towers.<sup>17</sup> When the civil servant Yezdi Gundevia was posted to Mirzapur in 1939 he suspected that no Indian had held the charge till then on account of the excellent opportunities for shikar in the area! Much of his time was spent following up tigers in the jungles and shooting geese in the ponds and lakes 18 Even after 1947, going out to bag a tiger was considered a 'must' for any aspiring forester. 'Bag your first tiger in your first year' was the motto of the first Indian inspector general of forests, who himself accounted for as many as 50 animals.19 Visiting heads of state could travel out from New Delhi into the hills of Rajasthan to try their luck. Prince Philip, for instance, hunted in Ranthambore as a guest of the Kaja of Jaipur in 1901, a fact ne was prudent enough not to mention in his foreword to a recent book on the area. 20 Till the abolition of privy purses in 1969, many rulers retained shikar rights in their former princely hunting reserves. There were efforts to protect endangered wild animals and birds, but the continuities in the personnel are again striking. The Indian Board for Wildlife had its first meeting at Mysore in 1952, with the Maharaja being the host. Among the key personalities in policy formulation in the early years were English tea and coffee planters like Randolph Morris and E P Gee, foresters such as PD Stracey and the Princes of Bhavnagar (in Gujarat) and Sandur (Karnataka).21 It was no great surprise that even the attempts to control shooting of tigers in the breeding season in Rajasthan were shot down. As the author of the proposal later recounted, virtually all the members of the advisory board that considered the issue were keen hunters.22

The legal continuities were equally significant. Most of today's wildlife parks have been carved out of either princely hunting grounds or reserved forests. The latter were part of the vast network of government forests taken over mainly for revenue and strategic reasons from the late 19th century onwards. The appropriation of forest wealth was accomplished by outlawing or severely restricting hunting and other kinds of forestuse by tribals and other forest-dependent peoples Though these efforts were often resisted by both overt and covert means, the legacy of the game laws was to be very significant for the early Indian middle class wildlife enthusiasts. They often uncritically identified with efforts to penalise quailtrappers and deer-catchers, even when the latter were mainly engaged in activities essential for livelihood.<sup>23</sup> As keen hunters themselves, they felt obligated to control those who were competing for the same resource. This extended beyond the human world to certain categories of wild animals. Thus, Randolph Morris and Salim Ali called for increased rewards for killing Himalayan black bears to help build up the numbers of the Kashmir stags. They aimed to save the deer from extinction, not shoot it for trophies. but this was to be achieved by imposing their own rule over nature 24 Similarly, Stracey praised the killing of jackal cubs to help game birds and of the eradication of wild dogs 'by every possible means' in order to help herbivores.25 The notion that predators had a role to play in nature's system and would not wipe out a prey species only acquired full official sanction with the launch of Project Tiger. For them, perservation of wildlife was equated with the protection of game birds and animals, whose natural enemies ought to be wiped out or controlled through intrusive measures.

restnetic sensibilities towards wild animals in general and to the much-despised large carnivores were on the horizon though this may not have been realised at the time. In 1961, a young Indian and her two sons recounted the scene in the Kenyan reserve of Amboseli in a letter home with the words, "It was fun to drive around and come across that comic, supercilious creature, the giraffe, the prosperous and plump zebra, fleet-footed gazelles of various kinds and the lordly and kindly (looking at least) lion and his family... Earlier we had seen a most captivating lion family: two lionesses and cubs". 26 Even two decades later, now as a keynote speaker at a UN conference in Nairobi, the same Indian would make the journey this time to the Masai Mara reserve on the Tanzanian border.<sup>27</sup> Already, in the 1960s, before her critical role in facilitating and pushing through the preservationist project, Indira Gandhi was perhaps symbolic of a new generation of Indians who related to nature not through the barrel of a gun but with binoculars and field guides. Even as a child, she lost the fear of snakes that is so common to many people. Her mother's youngest brother Ranjit Pandit, was 'passionately interested in all sorts of animals and at one time, 'anything you opened in the house' was likely to have a snake in it.<sup>28</sup> In her letters to the imprisoned Jawaharlal in the winter of 1943, she wrote of how the winter birds were arriving and she had seen two new species in the garden.<sup>29</sup> Living in the Teen Murti house when Nehru was prime minister, the family kept a variety of pets, including two tiger cubs, a young leopard and two red pandas.30 The first red panda was presented to her on a visit to Assam and was only identified with the aid of a book in a library and the injuries sustained by one of her tiger cubs was a cause of great anguish even for a busy prime minister, Jawaharlal Nehru. 31 At a public level Indira Gandhi hosted the first meeting of the Delhi Bird Watchers Society She was on its executive committee and also served as president for a brief period. The society itself was a very low key group, with talks and meetings at the Teen Murti house.32 Though politicians are often given to hyperbole, she was perhaps not exaggerating when she later claimed that she was, "one who had been interested in this subject long before Lever heard the word 'ecology'", 33 Aesthetic sensibilities were always central to her notion of a different relationship with the natural world: there were visits to the Himalayas which she compared to "Wordsworth's daftodils, an ever-refreshing memory". 34 These romantic overtones were perhaps also to do with a city-dweller's idealisation of the world of pastures, forests and hills. The idea of the oneness of life and a fascination for the powers of modern sciences also recur in her wntings.35

While Jawaharlal Nehru wrote the foreword to the book on India's wildlife by the naturalist Edward Gee a few weeks before his own death, it was only under Indira Gandhi that the wildlife issue began to receive attention from the head of government.36 One critical feature of this new development was the close personal equation she developed with a variety of wildlife enthusiasts. These included officials with a keen interest in conservation, most notably Kailash Sankhala who as director of Delhi zoo turned up on her birthday with three tiger cubs in a basket 37 He went on to serve as the first director of Project Tiger from 1973 to 1977. The hunter-turned-conserva tionist, Arjan Singh, a gentleman farmer from Lakhimpur Kheri in UP also received support from the PM who even asked the chief minister to assist the former who had been, 'ploughing a lonely furrow' 38 Salim Ali, the famous ornithologist who personally appealed to her to save the Silent Valley rain torest enjoyed a close rapport over decades and later praised her for having, "lent her full support to the movement" 19 Thus, both within the bureaucracy and in the middle class groups whoo took up the cause of vanishing wildlife, Indira Gandhi could draw on a core of support. The relationship was a complex one, with her drawing on them for ideas and extending support to their projects. In return, she cultivated a small constituency that saw her as being above petty politics. The importance of such links in the western world where eminent scientists and public figures expressed admiration for her is not to be underestimated 40 This was even more so during critical periods during the emergency and after her return to power Support for conservation could tide over her human rights record

Her own role was to be entical at several junctures, though this also points to the extent to which this set of issues both reflected and helped legitimise the central lisation and personalisation of decisionmaking power 41 The run-up to the Project Tiger saw her play a crucial role at virtually every step. In 1969, at the meeting of a leading international conservation body in Delhi, she won encomiums for her support to the ban on tiger and leopard skin trade Foreign exchange was important but "not at the cost of the life and liberty of some of the most beautiful inhabitants of the country" 42 The international conservation community, in particular the World Wildlife Fund (WWF), headed by members of European royal families and scientists had a hand in the process. Its trustee, Guy Mountfort, an expert negotiator personally lobbied her to constitute a committee that would report to her personally. Such a reliance on single heads of government also extended to dictatorial regimes. Thus, Salim

All regarded it as 'unfortunate' that Ayub Khan fell from power in Pakistan just when he was becoming pro-conservation. 43 Inside India, diverse groups would also directly approach the prime minister for action at a local level. In 1982, the Coast Guard was deployed to protect nesting sea turtles on the Orissa coast following a study by the Snake Park biologist J Vijaya. 44 Such a rapport did not exclude the Gandhian environmentalist Sunderlal Bahuguna who got an ancient oak tree in Naimtal saved from the army by writing to the prime minister 45 Even this brief list shows the variety of conservationists with close personal links with Indira Gandhi They included a forester (Sankahala), a dedicated wildlife lover (Arjan Singh) and a grass roots leader on forest issues (Bahuguna). At an organisational level, both old and new groups were represented. Salim Ali headed the Bombay Natural History Society (BNHS) founded in 1883 and the reptile specialists were from the Madras snake park founded in 1971. The centralisation of powers was at both an executive and later at a juridical level. Her letters to the Bihar chief minister in July 1972 did not mince words. She referred him to a complaint on the release of forest lands and said "Please look into it and stop it".46 In the 42nd amendment to the constitution in 1976, forests and wildlife were annexed to the concurrent list instead of the states list. This gave the union the formal right to overrule state decisions and laws on these subjects What is important is the fact that the small but influential wildlife lobby had won significant gains in a short span of time due to support from the PM 37 Her powers, even when in office, were not unlimited especially in the face of pressures for fresh development projects. This became clear in the case of Silent Valley in Kerala where the state government wished to build a dam in one of the last areas of wet evergreen forest. The green light had been given by Morarji Desai in 1979 Though his successor, Charan Singh leaned in favour of cancellation, it was Indira Gandhi who defused the issue by appointing two central review committees and eventually scrapping the project in 1983. In doing so, she also proposed alternative ways of generating power and irrigation water, as she told a senior UN official, "Each province or region gets emotionally attached to some schemes" 48

New initiatives included the end of all tiger-hunting, the creation of core zones in the tiger reserves where commercial forestry was halted and the expansion of the protected area system in 1980-84. The number of national parks alone increased from 19 to 52.49 In the process, however, the wider human dimensions of wildlife conservation, especially the vexed issue of local rights, received little attention. The eloquence of

Indira Gandhi in her speech to the Stockholm conference on the need for measures sensitive to people was often not matched in actual decisions.50 She admitted that people who fived in and around forests could hardly be urged to preserve wildlife unless their own conditions of living were improved.51 Pressure on the lifestyle of tribals was "causing her great distress". But power has its own logic and she pressed for more stern measures to ban tree-cutting in ecologically sensitive areas in the very same speech. But het ire was targeted at contractors rather than at the process of commercialisation itself. The attempt to enact a new forest law which would be much more stringent was given up because of tribal protest against a measure which seemed to reduced their own rights while not reining in industry 53 In Indira Gandhi's case, the key point was that her own personal awareness of the need for conservation has to be set against the structure through which she sought to achieve these aims. While she did refer to popular religious traditions like those of the Kashmiri saint Nand Rishi on the protection . of trees, she was cast in an Asokan mould 51 There was a major transition in terms of aesthetic sensibilities and often more so in a realisation that the ecological question had its own relevance for developing countries in an unequal world. But the emphasis on equity was absent in the world of realpolitik It is also elgar that wildlife conservation issues helped Indira Gandhi cultivate a small but influential lobby in the western world. even as her Stockholm speech affirmed her role as leader of the developing countries

The salient features of the preservation model evolved during her first spell in power were clear. Recovery centred on the extension of conservation areas, and on intensified protection wherever possible. The latter was attempted in the 'core areas' of Project Tiger and in any other national parks where the political circumstances permitted. All bounties for vermin were scrapped, and even removal of dead trees halted in the core zones. The maxim of 'do nothing and don't let anybody do anything' did not stop with forestry, but included local resident people The continuity lay not in ecological terms but in a wider social sense. The environmental heritage was to be saved through bureau cratic intervention in selected tracts. Wider environmental deterioration was a concern for preservationists but it was not prominent on their agenda. The uniform model of preservation was applied to lands with diverse ecologies. But biological conservation was founded on the premise of the exclusion of resident peoples. Even when the latter were tolerated in the 'buffer zones of Project Tiger, they were seen as a necessary evil.

But by now there were other voices in the debate. The new currents questioned not

only the glaring inequities that often accompanied the statist model but went beyond in advocating alternatives. What follows is an attempt to sketch out the evolution and basic features of the alternatives. The first group are the 'pragmatic conservationists' who hope to retain the existing system but making it much more sensitive to specific grievances. Next are the 'constructive workers' also close to the government apparatus, but much more geared to generating employment through more efficient use of natural resources. The third are members of the 'urban intelligentsia' often more forceful in their criticism of the existing administrative system as well as of market-driven strategies The last but the most politically crucial are 'rural activists' who often see local control as the starting point for change. While each of these strands has its roots in the past, my attempt here is to focus on the last two decades. The critics are drawn from a variety of backgrounds and, in turn, approach the issue of people and wildlife from very different standpoints. They all agree that the dominant mode of wildlife preservation is in a crisis. Where they differ from the preservationists is in their perception of what constitutes the problem. In particular, they draw distinctions between different groups of human beings and different kinds of ecologies. Many of the issues they raise are of wider importance. In particular, the kind of role they envisage for market forces and for the bureaucracy on the one hand and for rural producers on the other, is of much wider interest for students of social change

The categories are used here not as 'ideal types' but as classifications that will help tease out the rich and complex processes at work. They have been grouped together in terms of their responses to four critical aspects of the wildlife-people debate, their view of state control, their view of commercialisation, the importance attached to livelihood and their interests in maintaining biological diversity. As will become evident, their attitudes to these issues vary widely but still fall into a pattern. Two caveats are in order. None of the groups of critics subscribes to the prevalent model of growth. Most would agree with the preservationists that the reworking of the people-nature relationships is integral to a vision of a different society. The overlap goes even further; often, as in case of opposing the denotification of sanctuaries to make way for industrial exploitation, they may all find themselves on the same side of the fence. In fact, many of the critical voices of today are those of people who were hardline preservationists until quite recently. But that is to jump ahead of the story. The second caveat is a simple but crucial one. These are not water-tight categories and are not meant to be mutually

exclusive. It is possible that the activities of a person or activist group have undergone considerably shifts over time. The interaction between different groups, like the urban and rural activists, has often gone so far as to make a division between them difficult, But distinctions are indispensable in identifying patterns and processes of change.

#### PRAGMATIC CONSERVATIONISTS

The pragmatic conservationists share many of the premises of the preservation lobby but seek to attain the objectives in a very different way. Their main disagreement is not with the creation of protected areas or with totally protected core zones, but with the way in which officials exercise their powers. Their view is shaped by their own experience as field biologists, which often leads them to advocate a more proactive policy to control marauding animals or to intervene in natural processes. Livelihood issues concerning the rural poor are important to the pragmatic conservationists who see no future for wildlife without informed and sensitive steps to reassure cultivators or stock-keepers of their own security and prosperity. In March 1977, Indira Gandhi lost the elections and Morarji Desai headed the first non-Congress government in India since independence. A worried Salim Ali was impolitic enough to remind Desai that, 'Whatever little success' they had achieved had been because Indira Gandhi was a dedicated nature-lover. But Morarji set the wheels turning when he urged the ornithologist to consider afresh that he was only "preaching to the converted" in the cities. It would be so much more difficult to persuade a villager "to preserve the tiger or leopard that has deprived him of his sole worldly possession". The veteran scientist promptly wrote an editorial in the popular magazine, Hornbill, urging 'an earnest all out effort to tackle the problem at the grass root level.55 There was no longer any point in looking at the issues in isolation and the 'wider polity which utilises resources' had to be understood more clearly to achieve success.56 Salim Ali's brief article sums up the potential and the limits of the pragmatic conservationist approach, but its worth was only about to be realised in the years ahead.

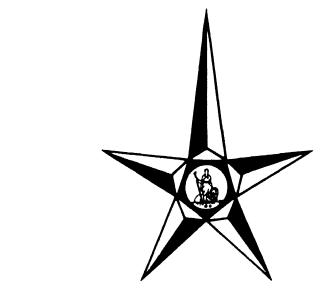

A year later, one of his own associates in the BNHS helped approve a grant to a young doctoral student at Bangalore who wanted to study the dynamics of elephant-human conflict in southern India. <sup>57</sup> Raman Sukumar's findings gave teeth to a new perspective on wildlife management. Saving the Asian elephant was the major objective underlying the research project but besides detailed field surveys of the species, Sukumar set out to look at the question of cropraiding by the huge animals. His main finding

was that a disproportionate amount of cropdestruction was by a relatively small number of male elephants. The herds led by females dubbed 'matriarchs' also did some damage but it paled by comparison. In order to alleviate the sufferings of the ragi cultivators, he favoured culling those male elephants that were certified crop raiders. Of course, the study itself weighed up various other factors, such as the fragmentation of the natural habitat by plantations, fields and dams, but it was the pattern of rogues and raiders that stood out. Interestingly, when these findings were first sent to a biology journal, they were not published as it was anathema to recommend the killing of a threatened species. This 'ivory tower attitude' to conservation (pardon the metaphor) missed out on the dual significance of the study.58 It sought to ensure the protection of biological diversity and to address pressing human concerns. This dual emphasis was not entirely unique. Others also urged decision-makers to pay attention to fears of people on the periphery of wildlife parks 59 Harjot Singh, a resident of Sampurna nagar on the outskirts of a national park in Uttar Pradesh was quoted as saying, "The law is a cruel joke. If a man kills a tiger he has to pay a fine of Rs 50,000 and undergo 10 years imprisonment. If a tiger kills a man, the compensation paid is Rs 5000. If the government wants to protect tigers, then why should it be done over our heads 2000 In West Bengal, some forest officers came up with innovative solutions to ward off tigers from attacking fishermen and woodcutters in the mangroves of the Sundarbans.61 But Sukumar's work was presented in a scientific study in a verifiable format. It may not have been evident at the time but it was only the first in the line.

The wider problem his work pointed to was the need to craft a solution to issues that continued to bedevil many areas in India with large populations of mega-herbivores or carmvores. The general picture of the retreat of wildlife under human pressure at the subcontinental level had to be squared with the realities at the local level. It was possible for a species to be rare at the macrolevel but to be present in large numbers in certain regions. The problem was to weigh which kind of human land-use was exacerbating conflict and to identify particular aspects of the behaviour or ecology of a particular species that made it or people prone to conflict. While elephants are crea tures of relatively wetter forests in South Asia, another large mammal living in more open, dry areas in northern and central India had been reduced to one relict population in Gujarat. The Asiatic lion, protected by the Nawab of Junagadh from around 1900 went through two population bottlenecks but by the 1970s was recovering under

protection. Studies by the American scientists, Berwick and Joslin and lobbying by the WWF had got the state government to shift many of the local buffalo-keeping Maldharis out of a core area of the Gir.62 Maldharis remained in the rest of the 1.500 square kilometre sanctuary but the objective was still "the 'restoration' of the rest of the reserve by the progressive withdrawal of the remaining cattle".63 As the lions, the prey and the vegetation recovered, a new problem surfaced: after nearly a century, the Gir had a spate of attacks by lions on human beings. A new study by Ravi Chellam from Saurashtra University overturned much of the earlier logic.64 He pointed out that the lion population in the reserve had built up and the territorial nature of the prides forced a spillover into adjoining areas. Here, the lions came into conflict with people and with cattle. Saberwal, then working on a project for the Wildlife Institute of India, followed up the details of lion kills of people and found that scheduled caste labourers who worked on pump sets at night were the most vulnerable. The policy suggestion was similar to Sukumar's remove the excess lions by capture or shooting. Further, there was no need to remove Maldharis from the rest of Gir. He still favoured curbs as on cutting down of the riverine forests, but in this new view, they could co-exist with the lions if they were given prompt compensation for cattle losses. Pastoralism and a large carrayore could co-exist because the forest cover in the area was still intact. To relieve pressure from incoming cattle, fodder reserves elsewhere ought to be built up. The rehabilitation efforts had been a failure with many of the relocated families being in a much worse state. The policy of relocation was held to be sound but its implementation seen to be tardy and insensitive.65

Pragmatic solutions also appeal to another genre of researchers who worked with wildlife outside forested areas. The birds and animals of scrub and grassland often live in the proximity of villages and setting aside large areas for protection is simply out of the question. The extension of cultivation over the plains regions and river valleys has advanced so far as to make it impossible to locate large stretches of land that are uncultivated The Aligarh biologist Asad Rahmani, an associate of Salim Ali, advocated a flexible strategy to protect the great Indian bustard. This ground living bird, the second heaviest on earth returned to certain patches for courtship displays and nesting. The key was to ensure the protection of such patches often only a few dozen hectares large. As these areas were often in revenue lands and on village grazing grounds, Rahmani favoured a mix of preventive and participatory measures 66 A similar but more conflictual situation emerged in studies on the wolf, unlike the tiger an inhabitant of the countryside in tracts with dryland farming and sheep or goat-rearing. The wolf has not only been known to lift children in areas like Palamau in Bihar but often lifts stock animals.67 The picture put together is a complex one. The wolves in western India actually gain from dryland farming as they can take cover in the field before the harvest with their young cubs. The extension of perennial irrigation, as in the case of the Rajasthan canal, will transform the situation.68 At another level, in areas like Nanaj near Pune, the shepherds despised the animal for raids on stock but cultivators saw it as the key to controlling the antelope numbers.<sup>69</sup> Clearly, survival for the wolf required an approach that took account of basic facts about its biology and behaviour. As a wideranging animal living in low densities, it perforce comes into contact with human settlements. Many shepherd communities regularly kill the cubs to protect their herds: the only answer would be to provide the wolf with a system of 'perpetual care'. The continued existence of vanishing species required sustained attention to the problems of those people who shared their habitats. 70

Certain basic features about the pragmatic conservationists are worth further attention. The conflicts between people and animals were broken up and viewed in a disaggregated way. Neither lions nor elephants were inherently dangerous, but certain individual specimens were prone to come into conflict with people. An understanding of their life cycles and the vulnerabilities of different groups of human land-users was crucial. In one case, the grain cultivators and in the other labourers and cattle-keepers were the most vulnerable group. Here, we see a widening of sensibilities towards different groups of humans. At the same time, the preservation of a species is critical but they feel, they do not have a duty to conserve 'each and every individual of the species'.71 The efficient management of a resource rather than an ethically driven campaign to make all human-animal relations equal marks the attitude of the pragmatic conservationists. The emphasis is less on the malienable right of all living things to life and there is a candid openness about the possibilities of earning more revenue or generating better incomes. The element of pragmatism is crucial. In the absence of strict measures against aberrant carnivores, the result would be a 'backlash'. None of these scientists sees an alternative to a role for enforcement agencies of the state, but they advocate exercising power in a very different way. For one, knowledge would not only be gathered through the official machinery which is often incapable of flexible responses because of a lack of information or research capabilities.

Sukumar's own initiation into wildlife biology had begun as a bird watcher in a small forest then at the edge of the southern Indian metropolis of Madras. By this time this forest, the Guindy park was already the site of innovative approaches to reptile conservation that were harbingers of change. It was here in the Madras snake park that Rom Whitaker and his team first saw that the organisation of wildlife economy based tribals as a step towards controlling the trade in Indian wildlife. His biographer is correct in observing that this idea was still ahead of its time, but in retrospect this was a step in a new direction 72 Constructive work may be the best category in which to fit the activities aimed at creative solutions around existing skills and within the exchange economy. In the process, such groups have often widened the terms of debate from one about preservation or total protection to one about possible sustainable long-term use Whitaker's own group worked in close conjunction with the Irulas, adivasis who once trapped small game animals, rodents and snakes for a living but were being marginalised by urbanisation and the clearance of scrub forests on the southwestern coastline. The effort was to draw upon Irula skills, to which the exchange economy was not alien, but to provide means by which they could get better terms of trade without depleting the numbers of reptiles These two broad features: of pushing for change by improving the bargaining position of 'losers' in development and of augmenting the resource base remain the hallmark of constructive work groups.

In the case of the Madras snake park, the origins lay in a protection venture centred on captive-breeding of reptiles. The small plot adjacent to the Guindy park was a beehive of activity, but the dilemma facing the Irulas soon became evident. The snake skin trade was of the order of thousands of skins a year, and the tribals found it profitable to catch the reptiles. The poem quoted by Zai Whitaker summed up the attitude in the Snake park, 'Russels viper, burning bright, Do not hiss and do not bite, We are trying to save your skin, From hand bags, wallets and their kin'. But the flip side of the coin was that snake venom was highly valuable, the poison from a krait being worth as much as Rs 3,000 a gram. By the late 1960s, the Irulas were not only the 'backbone of the snake skin trade' but were also catching snakes to extract venom for making antivenin. The bid to form a snake-catchers cooperative made only slow progress but the organisation was registered in 1978. Every Friday, Irulas from the areas surrounding Madras would make their way to the park with their deadly quarry, which would be milked for venom' and released a few weeks ater in the wild. The ban on snake skin exports and the curbing of the trade had vorsened the plight of the Irulas but the renom trade provided fresh opportunities. Amendments in the Wildlife Protection Act, 972 also allowed the capture and 'milking' if the snakes, in contrast to the normally strict ban on killing or trapping species that were endangered and under schedule I of the ict. 73

But it was not with snakes but with rocodiles that the break with preservation obbies came. The three species of crocodiles n India were rescued from almost certain extinction through a programme of captive natching and breeding in which the Snake ark and the Food and Agriculture Organisation played a critical role. Nationvide surveys showed a decline in numbers lue to variety of factors including dams on ivers, killing for skins and for bounties. Crocodile eggs were gathered and hatched or captive rearing, especially in the newly reated Crocodile Bank near Madras. The notion of a 'bank' was a deliberate one: except this would be a bank where crocodiles and not money would multiply.74 By 1994, here were over 20,000 animals in captive collections, both in the bank and in forest lepartment collections. However, the original purpose of the project was to supply skins to the market using captive-bred specimens. The idea was to harvest a resource in captivity, while the wild population would be augmented through protection and the release of captive-bred specimens. The part of the programme relating to marketing skins has never been realised, as the necessary legal changes have not been brought about. There is virtually no public record of criticisms of marketing crocodile leather, but there are two points often raised by preservationists. One is the problems of enforcement, for poachers could start a parallel trade. The other is the belief that such a trade would mark the triumph of an instrumentalist and exploitative attitude and would undermine the ethical notion that all organisms have a right to life. In recent times, such views impelled Maneka Gandhi as environment minister in 1990 to order confiscation of a dancing bear from its owner.75 The upshot of this is clear: the preservationist lobby has defended its stance. The problem is that such a view of nature, however moral it may be, Joes not often provide much by way of alternatives. The Irula co-operative itself is only a small pilot venture. But the principle of combining traditional skills with modern management techniques is a significant one. A recent proposal is to permit controlled harvesting of the turtle eggs in the great nesting grounds of Garhimatha on the Orissa coast not for trade but for local consumption. As several

hundreds of thousands of eggs are destroyed by the tides, this would not affect reproduction rates. Until the sanctuary was created in 1975, the local zamındar collected an anda kara or egg tax from fisherfolk and the foresters took the rest of the eggs for sale! The proposal is not to revive the old hierarchies or the trade but to give people 'a vested interest' that will create a socioeconomic base for conservation. Similar sustained use systems have been proposed for as many as six reptile species: these include captive-bred populations as well as wild ones. 76 The point about cruelty is acknowledged but as Indraneil Das asks; if domestic animals can be used why not wild ones?<sup>77</sup> The observation is of wider significance: nature does not occur in its pristine and pure state and the practices of capture or consumption by tribals or other direct resource-users seem 'cruel' to middle class people.

The 'constructive work' programmes concerned with forest revival are both better developed and more widely known. There are important parallels as well as contrasts with the debate on faunal resources. The struggle over control over forest lands in the colonial period have had their echoes in independent India, where the broad parameters of legislation and executive practice, have if anything, become even more stringent. Foresters have often seen trees in terms of their worth as timber, while across much of the peninsula, peasants and other villagers have drawn a wider variety of usufructbased products from the forests. These include nuts, fruits, leaf manure and twigs. The commercialisation of non-wood products, such as tendu leaves and harra fruits. sal seeds and mahua flowers has not been matched by better terms of trade for those who gather them. This exploitation of produce-gatherers by mercantile capital and governmental agencies is paralleled by an exclusive focus on regeneration of tree species critical for timber such as sal, teak. pines or eucalyptus. The constructive work initiatives in the forestry sector have moved beyond the agenda of employment towards regeneration through entitlement rights for direct resource-users.78 The orientation of such projects, towards multi-species forests. rather than monoculture stands, is conducive to a wider variety of bird and animal life The reafforestation programmes of the Dasholi Gram Swarajya Sangh over the last two decades have not only seen a very high rate of success in terms of survival rates but also focused on broadleaf tree species that are central to livelihood. This is in contrast to official programmes in Uttarakhand that have historically been oriented to plantation of coniters that are of limited use in the agrarian economy. The forest protection initiatives in three districts of West Bengal, Midnapur, Purulia and Bankura are perhaps the best known, but they have their counterparts in Orissa and Bihar. A share of forest products for villages in return for protection of the forests on a voluntary basis has enabled extensive regeneration of the sal forests. This itself marks a major shift in terms of technologies of forest management away from production of wood (from the tree trunk) to a host of products taken (from the crown) like twigs seeds and leaves. The relative success of joint forest management (JFM) in comparison to government forestry has to be seen in perspective: over 75 million hectares are under the forest department. and only a small fraction of the land is under JFM.79 There is also evidence that these practices may not be extended to the reserved forests.80 But the broad principle of joint control has been given a due place in rhetoric. Such efforts are significant both because they expand the ability of people, whether peasant women in Chamoli or adivasis in West Bengal to control their own lives. Such efforts should not be dismissed as 'reformist' as they are often a highly creative response to difficult conditions and have positive consequences at a wider level.81

More recently, there have been efforts to extend such an approach of Joint Management to the Protected Areas (JMPA). This effort seeks to build on existing arrangements while lobbying for legal and administrative changes. The central premise is that the long-term future of sanctuaries and national parks rests on co-operation of local people with any open-minded forest officer willing to be more accommodative of their needs 8 The arguments used are out of the book of the pragmatists as the claim is that this will help meet long term objectives of conservation. As Ashish Kothari writes, "I do not believe the Forest Department can exercise control even if it wanted to. It is not a question of whether we should try such alternatives or not; we have no choice but to".83 While he refers to several cases where popular action has stalled development projects, Kothari points to constructive efforts at conservation around the sanctuaries. Forest protection committees formed with the help of a voluntary organisation are helping check timber poaching in Ranthambore tiger reserve <sup>84</sup> In Nagaland. the Naga Mothers Association has campaigned against indiscriminate hunting Unlike government agencies, such groups can motivate people through educational efforts and can mobilise their energies. In official eyes, they play an auxiliary role and not a central one. The provision of basic services via voluntary efforts is also seen by some preservation groups as integral to their own objectives: by relieving pressure on the forests, they create alternatives for people living near parks 85 Yet, it is not on issues

AMAN LLOUR LETISTICE ON ROVER HITTERING COURTOL owards a more locally rooted system. But it was far from complete. Uncultivated lands were important for rural subsistence, while unchecked commercialisation was undermining the basis of survival of wildlife and poor people alike. Gadgil and Malhotra still advocated the creation of nature reserves in three per cent of the land area which would ne 'totally free' of human interference and levoted to the preservation of biological liversity.99 But the seeds of change were contained in the field work which pointed o a long history of human use of even supposedly 'pristine' lands. Critical interventions in public debates on dams and on orest policies by scientists also prepared he ground for more sustained critiques not only of forestry itself but of the wider systems of resource access that were weighted in erms of resource-extensive use by elites. 100

Events on the ground moved ahead at a aster pace. Unlike the government which ittempted to enact a more stringent law on orests in 1982, a section of urban researchers and activists veered towards the view taken by tribal groups. There were signs of this even earlier as in the support extended to he Chipko movement in 1974 by botanists rom Delhi and in the integration of ecoogical issues in local-level studies of levelopment. 101 But these did not have the wider resonances of the great debate over he 1982 bill. Deforestation and the decination of wildlife was seen as the outcome of commercialisation and of the degree to which forest-dependent people had no direct ole in the control of natural wealth. The survival of diverse multi-species forests was seen as linked with the struggle against commercially oriented monoculture plantaions. The mixed forests were seen as crucial n both ecological terms (as they harboured several plant and animal species) and for social reasons (as tribals and non-tribal peasants and artisans used a multitude of species). 102 The battlelines were drawn much more clearly when a student group from Delhi took up the issue of firing on cattlegrazers in the Keoladeo Ghana national park near Bharatpur in November 1982. 103 The former hunting reserve of the local ruler, the park had become a bone of contention between cattle-owners and the wildlife authorities. The Indian Board for Wildlife meeting in October 1982 (with Indira Gandhi in the chair) decided to close the area to all cattle. The decision was implemented overnight, and in the ensuing tension, the police shot and killed nine people. The report by the Kalpavriksh team had much in common with civil liberties team reports: it blamed the government for not giving adequate warning to the crowds. The patients were interviewed and the issue of compensating deaths was raised. But equally significant was the stance of the group, which was an environmental action group not a civil liberties forum. The closure of the sanctuary was held to be unjust as no alternative had been provided by the authorities. The report had a dual agenda of local rights and of wildlife conservation. It also quoted a BNHS researcher who felt that cattle access was not harinful to the water birds as it controlled the acquatic grasses. <sup>104</sup> Such findings did not receive much attention at the time but subsequently became important.

The next question was inevitable. Was it possible that conservation did not require areas totally free from human presence? Even where these were necessary, local level decisions might suffice. In any case, the core areas of wildlife parks were being reserved for scientific or aesthetic use, but this was a political point. The issue still remained of whether it was at all valid to search for a natural space that would be free of biomass extraction in toto. The legitimacy of schemes like Project Tiger from the very outset was in terms wider than aesthetic sensibilities. The creation of inviolate natural areas free from any human presence other than protective umbrella of the authorities was justified in terms of its contribution to protecting the spectrum of living things. By safeguarding these core areas from human beings, preservationists had argued they were ensuring that biological diversity was kept intact at least in these few oases. They could be baseline areas for research into the working of natural ecological systems. In addition to potentially useful plant species in the wild, researchers could document the complex inter-relation between water, soil and the fauna and flora. The view of these tracts as relict natural areas and their value in terms of biological diversity was central to the case. It is on both these counts that fresh perspectives soon began to emerge. Even in the Amazon basin, this notion of a nature free of human presence has increasingly come under critical scrutiny. The great basin supported large populations before the Spanish conquest and even now is critical to the livelihood of not less than 2 million people!<sup>105</sup> Similarly, in eastern and southern Africa, the notion of a primeval Eden was itself central to a notion of the continent as an uncivilised domain awaiting conquest. The same idea was adopted by many modern conservationists 106 The notion of a 'wilderness' could have even less validity in a subcontinent like South Asia with a much larger human population and many millenia of agrarian civilisation. The problem would not be one of discovering nature in its pristine state but of working out which kinds of human activity significantly reduced or enhanced biological diversity. But to do this it became necessary to see the forests, scrub lands or marshes as existing

inside of human history. In the struggle for control of these areas, the notion of creating a wilderness was a means to ensure control by preservationists at the cost of competing land-users. The issue was not one of nature versus people and became one of certain groups versus others. The idea of an inclusive idea of conservation meshed very well with innovative research in other parts of the world, particularly in Latin America, and even in some of the American Indiancontrolled areas in the southern US  $^{107}$  The keynote was not a romantic idealism about such communities but hard-headed scientific work about what kinds of biodiversity could co-exist in and around areas subject to continuing but regulated human use. The survival of rare plants in the sacred groves of the Western Ghats no more seemed like an isolated or unique case, but part of a wider pattern. Unlike state systems which had, till recently focused mainly on large mammals, these practices encompassed a wider spectrum of diversity. 108 This struck deep at the older stereotype. In recent work in the alpine regions of the Western Himalayas, other writers have also suggested a much more nuanced view of rural relations with the natural world 109 Not only do they eschew a romantic harmony', but they show how specific patterns of use may not be as damaging as was once believed. For instance, decades of Gaddi pastoralism in Himachal have not degraded the forests, unless the degradation is seen merely in terms of the density of timber trees. Similarly, mountain ungulates seem to be able to co exist with the Gaddis provided there is a degree of tolerance by the armed men who accompany the flocks on the trails. It is notable that the debate about levels of diversity has been posed by scholars in terms of extensive forms of land use such as pastoral production and swidden cultivation 110 The levels of plant diversity in various systems of traditional agriculture or of the local breeds of livestock can only be maintained if stock keepers and cultivators have a central role to play in the process of conservation. Not only are researchers not monolithic and united in support of exclusionary policies, the work in India parallels that in other regions 111 Scientific work parallels and complements efforts of social scientists to study the dynamics of collective action systems, of how they work and why they break up 112

The major break then is on the causality of the erosion of genetic diversity and the best way to conserve and enhance it. Gadgil and Rao argue the case in a recent draft bill on nature, health and education <sup>113</sup>. The bureaucracy is ill-equipped to meet the emerging problems of the ground, be it in terms of shifts in species abundance or diversity, or fresh threats due to pollution

OF VITOR BUSINESS FRANCISCO CONTRESSORY, THE diversity of resource-use systems that vary so enormously even over small stretches of the Indian countryside are simply not amenable to efficient or just bureaucratic land control. The rich regenerative potential of local systems of resource-use may not always be evident to a distant mandarın. More seriously, the information-gathering system at the disposal of the land managers as well as their skills may not register major changes fast enough. In contrast, local users have several practices that could be the core of a new strategy for conservation. They would be backed up with technical assistance and co-ordination but would have a central role in the process. The present protected areas as well as sacred groves and ponds, patches of grassland and desert scrub outside the PA system would be managed as 'safety sites'. Unlike the supply sites which would include the 23 per cent of the land area now under the forest department and the 6 per cent now under the revenue departments, the criterion of control would be 'safety' rather than 'supply'. The foresters and other technical personnel would remain in the picture but their role would be akin to that of the agriculture department in terms of providing support, services and incentives, not direct management. The PA system would not be managed in isolation but be treated as part of a wider regime of control.

There are many possible problems in this alternative model, but it is ideologically significant as it marks a break with a statist system of control. The early work on sacred groves or on rural lifestyles in the Deccan was much more limited in scope and suggestions but carried the seeds of these proposals. Incentives to protect diversity of cultivators were suggested in the case of the Nilgiri Biosphere Reserve. The Second Citizens' Report on India's environment also took a step in this direction. 114 This surely represents a politically significant development because a section of the skilled and educated literati is making common cause with disadvantaged groups. Such work brings together specialist knowledge with the emerging ground-level situation and offers a critique. At an international level, both biologists and social scientists are presently engaged in a debate over such issues and the Indian experience is not an isolated one. The bill draws together these findings and seeks to articulate elements of an alternative structure. The actual problem in such models is their treatment of market forces. The community is to serve as a line of defence against corrosive impact such as species extermination to meet market demand or to mediate in case of conflicts over resource use. But it is not at all clear what is to stop a hamlet from cutting down a forest or draining a wetland as long as

mere are minimulate economic retarns possible. Many collective action systems in montane and semi-arid areas where they are probably still the most resilient, are in a transitory phase. They were never static in the past but the levels of internal differentiation and the external pressures today are of an unprecedented nature. The question is not whether such devolution must take place. There is little doubt that many of the points made by the urban intellectuals are valid: these systems are more flexible than a bureaucracy and involve people with more direct stakes in the viability of forests or wetlands than in the case of distant administrators. But the issue is a more complex one, of designing a structure of incentives that will enable such initiatives as exist on the ground to endure the impact of pressures. This, in turn, will only be possible in the context of wider changes in the system of land-use. The insights provided by the urbanbased researchers and activists still have considerable relevance. The challenge is to try and work out a system of control that combines local control with tangible benefits that enable a better livelihood but also enhances the resource base. This is easier said than done. But it is a vast improvement on a tunnel vision that solely concentrates on a few protected zones protected by guns and guards. Over two decades, the urban intellectuals have gone from studying alternative systems to favouring a radical shift in the power structure to meet the dual demands of conservation and human livelihood. They have taken a step towards a notion of empowerment of disadvantaged groups, a programme which has often been integral to many movements of political assertion, but which is now being supported on new grounds: its ability to conserve biological diversity.

#### RURAL ACTIVISTS

Of the above mentioned groups only the constructive workers have any direct material stakes in the outcome of human-wildlife conflicts. The rural activists are directly engaged in efforts to secure a direct participatory role for resource-users in the control of open access or common property lands, government forests, ponds, pastures and wildlife sanctuaries. The improvement of rural livelihood and of living conditions is central to their perspective and the recent attempts to defend natural areas from developers have to be seen in this light. The creation of wildlife sanctuaries seems to such groups to be simply one in a long line of events that have deprived them of their land rights. In the past, this loss of entitlement often entailed a deeper sense of cultural loss. Rural activists, obviously, do not work or exist in isolation from wider networks of protest groups that include those in towns

they share the consequences of ecologica deterioration or social dislocation with those affected by wildlife conservation, big dams or commercial forestry. What matters less are the social origins of a particular activis group, and much more the kind of issues r focuses on. They take up mobilisation agains dominant groups to a greater extent than the constructive workers. In fact, tribals petitioned a government committee in 1960 against the creation of a wildlife reserve ir Andhra Pradesh. Their complaints were explicit and clear: the creation of a game sanctuary in the Narasampet meant tha "They cannot hunt. They cannot even ge wood from contractors; they cannot extrac kopi grass which they have always used for making ropes. The once proud Koyas hunters and lords of the forest...are today forbidden even to enter the forest and are deprived of all rights and privileges they formerly had. They cannot even remove a few stones from the area to pave the path: of their villages."115 Yet such concerns remained at the margins until they were again taken up in the 1980s.

The new wave of social movements did not often directly take up the wildlife question but the implications were clear a in the case of Chipko. The Valley of Flower sanctuary was not tar from the hamlet o Reni where the village women stopped a sports firm from felling trees in 1974. Thi movement or 'Chipko Andolan' soon wor wide acclaim, and by 1980, some of it leaders were vocal in their criticism or restrictions on usufruct rights in the Valley of Flowers. The area had long been importan to nearby villagers who harvested wild tuber but this limited use was seen as destructive by the forest department. This marked. wider agenda inclusive of plant diversity than has been the hallmark of officia strategy.116 These form a parallel to the drive by the preservation lobby to hal commercial forestry in the core areas o tiger reserves. The difference was crucial the activists saw the survival of the mixe forests as essential for the sustenance of rural people. The displacement of village to make way for wildlife, though not withou precedent, was taken up under Project Tige areas and in the Gir forest by this time. Sinc then, the terms of resettlement and th question of how far displacement is essentia have been a major bone of contention. A the time there was little sustained protes But such strategies of creating 'people-free zones at the core of wildlife sanctuaric were attempted in many other areas. Th issue became especially tense when it wa linked up with the much wider problem of the restriction of usufruct rights. Under th Wildlife (Protection) Act of 1972, there wer no rights of access in national parks. I

many areas, this led to protests. The Bharatpur firing in 1982 has already been taken up. In this case, the investigators were drawn from a metropolis and could not make much headway as the villagers were intimidated by the local authorities. Since then, the degree of mobilisation in and around the PAs and the kind of links, this time with the small town intelligentsia, have caused a seachange. The expansion of the network of protected areas and the intensification of protection measures have provoked a strong response from resident peoples in many areas.

This pattern emerges clearly in case of the Rajaji park near Hardwar. Carved out of the governor-general's old Shooting Blocks, the park is home not only to diverse wildlife including UP's largest population of wild elephants, but also to several people. The local Gujjars who are allied to the group Vikalp, rebut the forest department's charges that they are overgrazing the area. In 1979, the government decided to move out the Gujjars and resettle them in a housing colony. Their case has wider significance. Firstly, they point to the shrinkage of lands along their old travel routes due to extension of cultivation and forestry: confined to a smaller area, they see themselves as the victims of the process of development. Secondly, they refer to the extensive encroachment on the forests of the area by an irrigation channel, an army ammunitions depot and several public and private sector industrial units. In addition to mass protests in 1991-94, they also challenged the administration to hand over the park to them for direct management.117 More recently, in conjunction with the Bombay-based Indian People's Tribunal for Human Rights, they organised public hearings by a retired chief justice of a high court. Among other issues, Justice Potti also enquired into possible alternatives to defuse tensions while protecting forests. The report itself is a complex one: it offers a critique of the existing arrangements for rehabilitation and calls for a more acceptable package that addresses the needs of the Gujjars. Justice Potti raised the issue of compensation for victims of animal attack and suggested they be made equal to those given to airline crash victims. In the longer term, Vikalp argues that the survival of Rajaji and nearby forests is not possible simply through sacrifices by the resident population. The diverse groups in the area: the Gujjars, the inhabitants of the forest villages who are tenants of the forest department, taungyacutters who were brought in to raise tree crops, artisans who collect buan grasses from the forest for rope-making, all took part in the consultations. This itself was significant as the diversity of interest groups 18 often held as a reason against local control. No easy panacea emerged but the very existence of the process was significant. 118 The destruction of the forest is the consequence of wider processes of social and economic change that need to be taken up. This is illustrated with reference to the firewood demands of the nearby town of Hardwar which powers denudation of substantial areas. In fact, travelling to Hardwar from Delhi, it is impossible to miss the multi-storied flats that are creeping up towards the river, cutting off the route for the few bull elephants still courageous enough to make the journey. 119 The Gujjar and the elephant are both hanging in the balance and the former are fighting back.

Nor is this an exception. The general impact of industrialisation and the double standards adopted by the administration to forest dependent people led to the organisation of the Jungle Jeevan Bachao Yatra ('Save the Forests, Save our Lives' march) in 1995. In the recent past, this technique of processions criss-crossing the countryside to bring together affected and concerned citizens has been a favourite of environmental movements. There have been many yatras like the Askot-Arakot march of Chipko students in 1974. Sunderlal Bahuguna's Kashmir-Kohima trek in 1982, the fisherfolk march along the sea coast in 1989 and the long march of the anti-dam protestors in the case of the Narmada project in 1992.120 But this was the first time that the wildlife-people issue was taken up through this medium. At the end of the 15,000-kilometre march the organisers issued a statement denouncing the creation of 'sarkari sher aur sarkarki ped' (governmental tigers and trees). 121 In most places on the route, at the Gir forest in Gujarat or at Rajaji, the tale was a similar one. The deprivation of access to the forests or natural areas had deprived people of sustenance but opened up the area to contractors and other rapacious developers. It is noteworthy that groups like the Tarun Bharat Sangh in Sariska have done more than protest against closure of access. They have planted indigenous trees on common lands, fought mining interests to a standstill until the state government stepped in on the other side. This consciousness is also evident in the revival of protected forests known as rhoonds, and deobanis that are protected by the villagers. 122 As in Rajaji, the 'petty oppressions' by the forest department have been a major grievance. They only illustrate the wider dilemma of a department with rights over residents and usufruct right holders. 123 The upshot of the Yatra of 1995 was itself mixed and it attracted criticism from some quarters for not being strident or radical enough. 124 The debate continues but the significance of the event is easy to miss out on. The Yatra was designed to act as a stimulus for further contact and dialogue and in the six months that followed it, grass

roots groups in three states have organised their own networks to continue contact and exchange of information. What are the main contributions of the rural activists involved in the Yatra and elsewhere in the country? Firstly, it will now be difficult to use coercive powers to relocate or displace people in and around protected areas. Unlike urban intellectuals or pragmatic conservationists, most rural activists live and work among the communities whose cause they espouse. Their strength is also linked to a significant change: the willingness of politicians to be more sensitive to rural protests. 125 Such changes are due to executive action and rural activists demand legal rights. At present, the collector may grant concessions under an amendment in the wildlife act made in 1991.126 Livelihood issues are paramount for the rural activists, who see the bureaucracy as having failed to improve the living conditions in these areas. Commercial interests in particular non-tribal traders and large industry are regarded as exploiters of both people and nature. If these terms seem ambiguous it is necessary to reiterate that unlike the other groups studied here, the rural workers are not attached to institutions. of higher learning and are engaged in mobilisation often against heavy odds. Their view of nature and the question of biodiversity requires more elaboration and attention. One approach has been to see them as standard-bearers of traditions that are more in harmony with nature than the industrial mode of development, socialist or capitalist. Since wildlife is not always central to the agenda as in the case of preservationists, the rural activists are often pilloried for not being sensitive to long-term issues. In fact, the point can be tuned around. In several cases, certain projects which would be deeply damaging not only to wild animals or plants but to the ecology of vast areas have been stalled only because of rural protest by disadvantaged social groups. What is valid is the fear that a successful movement for assertion may not be able to control deeper market forces that may corrode the resource base. But bureaucratic regimes have hardly done very well on this count and have facilitated and assisted such corrosive forces.

The preservationists are strident against claims of rural activists who advocate continued use of the protected areas. Surely something is seriously wrong with a system that cannot provide for the disadvantaged from 96 per cent of the land area. The rural activists reply that they were not involved in demarcating the 4 per cent and in any case, this struggle for control is by no means restricted to these areas. The other problem, of providing safe havens for plant and animal life free from all people, does not appeal to the rural activists in the same way that it does to the preservationists. The activists

feel that tribals or pastoralists have a better record of living with natural systems than urban or rural elites. Sacred groves and religious taboos on harvesting wildlife are cited to buttress such claims. If at all, core areas are to be set aside, the activists would claim that the residents have to play a part in delineating the zone. Such areas can possibly be created elsewhere, but the nub of the problem will lie in participation and control which cannot be left solely with the authorities. The emergence of networks of the action groups working on the periphery of protected areas is a major landmark. As with the forest question, local experiences are now being discussed at a wider level, not only in terms of solidarity and joint action, but also to evolve a common platform The actual evolution of institutions and mechanisms for rural control has a long way to go, but the process has begun. Local control cannot, in itself, resolve issues: the wider institutions of governance can often be more than willing to bend over to industrial interests.

#### A PROCESS OF INTERACTION

The critics are largely united by their disaffection with the prevalent mode of preservation. They do not believe in a policy of total environmental protection. Their grounds for criticism and their levels of alienation from the dominant model vary and there is also room for mutually contradictory views among them. In their own ways each is questioning the forest department's monopoly of power and knowledge in the protected areas. Though their concerns and prescriptions vary, the critics stand for changes of strategy and policy viva-vis the conservation of biological diversity.

This is most clearly evident in case of the rural activists and the pragmatic conservationists. The former have a constituency that primarily consists of the rural poor who live in hilly and mountainous regions, areas with dryland agriculture and animal husbandry. These are populations partially or wholly reliant on gathering forest products whether for subsistence or for sale. The relocation of such villagers, whether tribals or caste Hindus, to make way for wildlife, is strongly opposed by the rural activists. Pragmatic conservationists, while often critical of the administration's insensitive methods, broadly agree that people must be removed from prime wildlife habitats if this is essential for rare species. The question goes beyond one of rehabilitation and relocation to usufruct rights. The pragmatic conservationists are mainly wildlife biologists whose prime aim is to evolve management programmes for specific species. They approach the issue from the standpoint of enhancing the survival prospects of their target species or

ecosystems. Their findings often pit them against the older 'hands off' approach of the preservationists, but their methology is still geared to the wildlife much more than to the people. Rural activists, at least those who are sensitive to ecological issues, see the issue in terms of livelihood and survival of social groups marginal to the power structure. It would make little tactical sense for them to admit that the sustenance of disadvantaged groups may at times be in irreconcilable conflict with wild plants or animals. Their prime focus is not only on redressing grievances, which the pragmatic conservationists are willing to acknowledge. Some voluntary groups have gone so far as to ask that they and other local residents in and outside the park be given control of the area. Such a prospect would not be welcome to even the most open-minded of the pragmatic researchers. Where there is room for joint action it is with regard to specific grievances such as wild animal depredations on crops or attacks on people. The biologists who have documented these problems in detail are in a position to lobby governments to be much more responsive both in preventive terms and to provide effective compensation. Ironically the very structure of consultation that incorporates such experts also slows down remedial action. Professional foresters are apt to look upon the researchers as upstarts and to drag their feet on implementation of programmes for culling male elephants or lions as the case may be. The research scholar who has logged several hundred hours tracking the wild animals or assessing crop damage is still marginal to the community of forestry. They may have the expertise but they lack directorial power. As members of the middle class or literati they do not experience the problems of deprivation so clear to the rural activists. But there is little doubt that the pragmatic conservationists are the most ambivalent of all the groups of dissenters and critics. Their findings point in one direction and their professional Lie makes it essential for them to remain in close contact with the very branch of government whose choices they often disagree with. The growth of autonomous research institutions has increased their leeway and given them a separate institutional base outside the forest department, but they can go a certain distance and not beyond.

Rural activists have a much wider agenda and programme. They seek to question not only wildlife conservation policies, but the wider gamut of issues related to development. These include the terms of trade with the mercantile groups or the foresters who purchase forest products, the denial of land rights and credit to the poor and the more mundane but critical problems of the lack of even basic social services such as health

and education. The strategy is one of struggle, all the more so because they are often at loggerheads with the forest department which is their overlord or controls access to grazing grounds. Increasingly, human rights violations have come to be prominent in the issues raised by such groups. These efforts are now backed up by their allies in urban areas who also call for an alternative mode of conservation and development. The urban intelligentsia has now come to identify with the rural activists' agendas much more closely than in the past. Alternative systems of protection such as sacred groves were initially seen as an adjunct to the existing PAs but the debate has now moved ahead. The emergence of cross-regional and state level co-ordination has had a lot to do with the joint efforts of the urban intelligentsia and the rural activists. What is equally important is the strong advocacy of decentralised systems of resource control. The Gadgil-Rao bill of 1995 calls for an extensive restructuring of control of the existing protected areas as safety sites, giving villagelevel committees a central role in delimiting boundaries, assessing crop damage and ensuring protection from rapacious commercial interests. It is true that the links on the wildlife front are still nascent compared with the networks on large dams or commercial forestry. But this has to do with both the new wave of protest against sanctuaries and the awareness among both urban and rural concerned citizens that the destruction of the natural areas was not their objective. The issue being contested is not only one of equity but also of sustainability: this may have been implicit in many adivasi or peasant movements in the past but it is being made in an explicit manner now.

There are still differences in emphasis between the urban and rural advocates of local control. The former often attach considerable importance to biological diversity and often favour service charges to communities or groups who protect rare plants or animals. By the 1990s, many radical rural groups who would once have scoffed at the notion of rights of nature having an intrinsic worth, have come to champion such notions. They ground their case in the continued existence of tribal or peasant traditions that view nature not as separate from the human world but as part of a unified whole. The urban intellectuals, often a part of the middle class, acknowledge the role of such ideas but they are more sceptical of their viability in the face of market forces. Perhaps, this is the strongest and weakest part of their case. They are on good grounds in favouring positive incentives for conservation. This at least makes an ideological point, namely that it is the Maldharis of the Gir who should be rewarded for coexisting with lions. They can and should be turned

#### FLY INTO THE FUTURE WITH ME.

Air India has grown from strength to strength Expanding its fleet. Opening up new destinations worldwide. Introducing new schemes for passengers and travel agents alike. And enhancing service standards at every level. Thus becoming an airline that s ready to take on the challenges of the 21st century.

from antagonists or victims into protectors and it is the duty of society at large to assist them in every way possible. But it is still not clear how such incentives are to be worked out in economic terms. Local protection is often a success because it is rooted in cultural or religious notions and practices. It may not be possible to affix a monetary value on the protection of pipal trees in a village grove or of sacred crocodiles in a lake. In trying to defeat the market system, the urban intellectuals have to beware of siding with the very forces that may undermine their wider aims. At another level, some among the urban intellectuals have probably gone too far down the road in romanticising traditional systems. This is significant insofar as it displaces the old stereotype of rapacious and destructive tribals or peasants who will destroy the fauna and flora unless checked by government. It is also important that the ways of relating to nature that were earlier considered the preserve of the ethnographer be studied by biologists or historians. The division between 'science' and 'local knowledge' may have been necessary two decades ago to prevent uncritical glorification of the former and outright dismissal of the latter. But it may be much more useful to simply have a critical perusal of 'actually existing practice' rather than romanticise traditional systems. This is especially necessary considering the degree of market integration and the rates of demographic expansion that we are often dealing with. Self-reliant agrarian communities linked together in a loose federal arrangement may or may not be ideal, but they are hardly practicable in today's world. In any case, a dialogue about actually existing practice will enable much more creative and relevant interventions both at a conceptual and a practical level.

Both rural and urban critics need to be much more specific about what we mean by local control. Many protected areas contain people living within their confines, on the perimeter and groups who may reside further away but use the tract at certain times of the year for limited purposes. 127 Further, there are those who draw on fodder reserves in sanctuaries in pinch periods as when the rains fail. It is not often clear on what basis local control will work, whether the criteria are to be the length or place of residence. Even more complicated is the conflict between locally resident cultivators who may use a forest and nomadic groups with herds who are themselves the victims of land acquisition by government but add to the pressure on the resource base in or around a sanctuary. The usual answer is to allow such issues to be decided by consensus and open negotiation. This still does not explain what the minimal points of agreement will be and how they are to be ascertained. Even more crucially, who is to play the mediating role if not the government in a democratic system? And if it is to be the administration, there is the vexed question of which element in the bureaucracy is to be given weightage and how it is to be made accountable and transparent. Local control can only work within a wider framework conducive to conservation and less prone to short-term growth of the kind that corrodes the resource base. There has to be a role for the state but it will have to be very different from what it is today. There is also some sign that, as in several strong agitations against denotification to facilitate industrial interests, local people will have a prior say before such denotification is permitted. Similarly, the existing arrangements under which the wildlife wing assists in protection of sacred groves or waterbird santuaries maintained by villagers could be given a new legal status as 'people's protected areas'. Yet, these measures may not go far enough. There is an urgent need to go much further in evolving alternative systems of control that build on existing efforts but strengthen them. If the rural or urban critics of preservation are to succeed, they have to evolve alternative structures of power.

The constructive work groups have a very critical role to play. Their strength lies in their ability to evolve creative solutions to existing problems that not only improve livelihood but also increase the elbow room of disadvantaged groups in their struggles. In the process, groups have come up with workable alternatives that expand the scope for reform within the existing system. The question which still remains is how far these efforts can supplement the work of rural activists or urban reformers in evolving an alternative framework. The problem of tapping market forces for conservation is all the more problematic. If it is a question of organising co-operatives for venom-extraction or for tendu leaf trade, there is no question that organisation is essential to bargain with middlemen or government agencies. The danger here is that constructive work may often stop at just that, and the massive injections of funds now being made may simply give a fresh lease of life to the old way of operation, in which government departments increase their own clout through injections of funds.

#### CONCLUSION

If the older preservationist agenda looks like it is in usept buble, it still has a lot of life left in it. The crisis of an old order need not necessarily be a prelude to its collapse. None of the critics named here has any sympathy for the agenda of unreconstructed developmentalism that the preservationists did so much to critique. Their shortcoming was their reliance on the state machinery,

in particular on legislative and executive power of the union government. The power of the centre in development policy is now much more limited that in the early 1970s, for both political and economic reasons, but the pressure for generation of revenue and attracting industrial investment is all too real at the state government level. The critics of today often equate the preservationists with the forces of short-sighted development. This is perhaps correct insofar as both support the existing power structure and only disagree with the way power is to be exercised. One wants to cut down a forest to make way for dam, the other to save it for scientific research and leisure. There is still a deep antagonism between the constituencies of the middle class preservation lobby and the rural activists. Wildlife enthusiasts feel that animals have primacy over villagers at least within the wildlife reserves. There is "no other way to successfully run a reserve, and there can be no compromise on the issue". 128 This is the nub of the issue: in their own ways, all the groups studied here are convinced of the viability of alternatives. Nowhere will the struggle for control be as sharp as between the rural activists and the preservation lobby. Protection of wildlife 'for its own sake' was both a utilitarian and a romantic endeavour. It was preserved for a certain kind of use (scientific research or wildlife-watching) in preference to other uses (livelihood and survival).129 In the Indian case, neither a technocracy or bureaucracy acting as the arbiter of conflicts nor a free market system which may tilt towards privatisation of open access resources would address ecological issues adequately. The assertion of people's rights has the potential for a different kind of conservation-oriented control of their lives and lands. The very idea of a forest separate from people is seen as "an illusion" that only denies, "the unalienable relation of nature to man". The question itself becomes one of working out a new set of relations with the forest which will be enduring for both people and the natural world.130

How this will be done at a time of demographic growth and agrarian intensification will be a major challenge and site-specific approaches will probably play a vital role. These issues cannot be divorced from the wider ecological dilemma. Local institutions may be open to corrosion by market forces, due to a combination of external pressures and social change among what may seem like homogeneous rural communities. The risks inherent in political reform must not be allowed to postpone change but the wider economic context of incentives for destructive behaviour has to be changed if there is to be any hope. This issue calls for more thought and action. Some arch-preservationists may look back on the 'golden era'

of the Indira years and yearn for them.<sup>131</sup> But the clock cannot and should not be turned back. The maturing of democracy and political assertion by disadvantaged sections is now far more advanced than in the Indira era. The traditions represented by Vedanthangal are now locked in contest against those symbolised by Asoka.
